France has not yet got over her alarm at the discovery of an international syndicate of church-looters, when she is confronted by the much more serious danger of a "syndicate of traitors," or an "association of international spies," five of whose leaders were arrested this week at Toulon. From a rapid examination of documents taken in the raid, the police are inclined to believe that "the gang has for a long time been carrying on an extensive traffic in military and naval secrets." Popular imagination likes to conceive the Mafia and the Black Hand as world-wide societies with a highly perfected organization, which allows some mysterious grand chief to press a button and send murder and sudden death thrilling along every cable under the seven seas. At the present moment, the editor of a New York Yiddish newspaper is reported to be awaiting calmly the fulfilment of the sentence of death passed on him by the Russian Black Hundred But the idea of an international syndicate of traitors is incomparably fascinating. Nations will no longer be forced to maintain expensive secret service systems, or to cling to antiquated small-producer methods by bribing a captain or a lieutenant here and there. An application, in a printed envelope, addressed "Iscariot, P. O. Box 23, Zurich," will bring Germany all the information she desires about the fortifications on the northeastern French frontier, or acquaint the American government with the exact disposition of the Japanese army, now secretly encamped in Hawaii.

RETURNING REASON.

The results of the election, falling together with events in the financial world, seem to us to promise a period of more rational politics. The explosive and clamorous politicians have been pretty thoroughly found out and discredited. Hearst is under a large-sized extinguisher. Bryan cannot get any possible cheer out of the election returns: his own State went against him again, and his lieutenants in Massachusetts made a magnificent wreck of a great party opportunity. The President, too, is sobered. His political astuteness, if nothing else, may now be counted upon to lead him to come out as the most cautious and healing of statesmen. He may be depended upon to use the great powers of his office to help steady the country's affairs. The bare official announcement that the President is to make no more public utterances for a month, is, as Carlyle would say, significant of much.

If we are truly to have a reaction from our sensationalized politics of the past few years, the change will be great and refreshing. Few of us have stopped to reflect how the nerves of the nation have been successively racked. By turbulent methods, by loud outcry and the shouting of the captains, we have somehow come to believe that politics means a continual *tour de force*. Somebody must be always in the limelight, gesticulating and vociferating. Every campaign must be a whirlwind. The people must more and more be driven frantic; and the gravest political questions must be decided by the larger volume of applause. We will not undertake to apportion the responsibility for this state of things. The sensational press cannot escape its share; but the chief blame lies with those politicians who have sought to keep the masses perpetually agitated, who have thrust one question after another to the front, and insisted that it be settled at once, and that by dint of lung-power rather than the prevailing of the better reason.

This style of political progress, by plunging and squealing like a six-mule team, has been much practised for the past decade; great individual successes, or notorieties, have been achieved by means of it; but there are many signs to-day that the people are tired of it, and that we are in for a quieter era. The country has seen the results of ripping things to pieces, and keeping everything in a whirl, and is now looking about for a party and a political leader to do a little of the humdrum work of restoration and construction. There can be little doubt that it is this new attitude of mind which has caused so many people in so many different parts of the country to turn to Gov. Hughes. They have heard his confession of political faith, as made in his address at Columbia University—namely, that it should be the great aim to apply reason to public affairs. They have also seen him proving his faith by his works. And the extraordinary and unforced feeling, manifested so widely, that a man of his type ought to be chosen for the Presidency, is of itself a striking indication that we are passing out of an excitable time of upheaval, into a calmer and saner period.

Of course, when we speak of applying reason to politics, the larger reason is intended. The truly rational politician must take into his reckoning all the facts of political human nature; must know what things can be done, and what cannot be; must be responsive to the desire for improvement, his effort being to direct it wisely. Reason is opposed to passion, or vindictiveness, not to progress. Only, the progress must be along tried paths and by sound methods. Out of vague unrest or disturbance, the rational statesman must be able to find a way by deliberate use of sensible remedies for public dissatisfaction. The two capital examples that Gov. Hughes has given are in the field of insurance and supervision of corporations. After the excitement and the scandals of the insurance investigation, a new code of well-considered laws emerged. That Mr. Hughes should have been able to digest the results of the inquiry in his report to the Legislature, and then not only draft but carry the appropriate legislation, has been described by a competent authority as a great intellectual feat. But it was more than that: it was patient and constructive statesmanship. And of the same kind in planning (we cannot yet pronounce fully upon the results) was the measure establishing the Public Service Commissions. In either case, what we had was, after the earthquake of investigation, the still small voice of reason: all the facts firmly grasped and dispassionately studied, the necessary changes in the law worked out and put into operation.

That is the ideal of rational politics which Gov. Hughes has so well exemplified. Over-zealous friends of Roosevelt speak of the Governor as a "reactionary"—or, at least, say that those who are talking of him for the Presidency are all "reactionaries." No mistake could be greater. Steady and sane progress cannot be called reaction except in contrast with the mad and blind rushing ahead which ends in the ditch. There is nothing of the rest-and-be-thankful attitude in Gov. Hughes. He would vie with the next man in maintaining that there are great problems in connection with corporation control which the country is bound to attack. The difference is that he would do it without haste or passion, and by bringing to bear the best collective judgment of the nation.

If the people are indeed returning to reason, it is not strange that they are casting about for a reasonable man. Hence the force in the contention that the elections of last week, with their rebuke to agitators and hot-heads, have greatly increased Gov. Hughes's chances of being nominated for the Presidency.

THE TARIFF ON PAPER.

That the President would sympathize with the American Newspaper Publishers' Association in its appeal for the abolition of the tariff on press paper, wood-pulp, and all the wood that goes into the manufacture of paper, was to be expected. Perhaps something of Theodore Roosevelt the free-trader of bygone days stirred anew in the Presidential breast. Besides, he would be a rare politician who in these days should be adamant to the wails of a united and suffering press. And so the President has promised not only to recommend in his annual message to Congress the abolition of the oppressive tariffs, but also to urge the Department of Justice to ascertain if the paper manufacturers are violating the anti-Trust laws.

Whether the President was able to control his risibles at the spectacle of representatives of the most determined "stand-pat" newspapers demanding free trade in paper, while insisting that not another hair on the hoary tariff head should be touched, is not reported. But his sense of humor makes it impossible that he should have failed to appreciate the joke. He is, of course, fully aware that in the new Congress his recommendation will fall on deaf ears. His political legatee, Secretary Taft, has given reasons why there should be no tariff changes until after the Presidential election. These every "standpatter" who wishes to keep the tariff on paper can cite as having been directly inspired from the White House. But it is not only the approach of the election which will block the way to this desirable legislation; the representatives of the publishers will speedily learn that to make a single change in the tariff now may endanger the entire structure. Senator Burrows, for instance, lamented with all solemnity the other day the inability of his party to alter certain schedules obviously too high until it could go over the whole tariff. Two years hence, however, when the general overhauling will be in order, dozens of statesmen will rise to urge that tariff readjustment, if any, be made by changing only one schedule at a time. By such tactics, revision may be postponed till the Greek kalends.

If the Republican party really wanted to end a flagrant wrong, this would be its opportunity. Gladstone attacked the same problem in England in 1860, in the face of great opposition. Conservatives the country over rose in arms at the suggestion of free paper. It would flood the country with cheap and pernicious newspapers; it meant the establishment

of a "daily propaganda of socialism, communism, red republicanism, blasphemy, bad spelling, and general immorality." The House of Lords voted down the bill abolishing the tax—but to its cost. Within a year, Mr. Gladstone had retaliated in a way which has ever since tied the hands of the Lords in matters of finance and taxation. He adopted the simple expedient of sending to the Lords in one bill all measures affecting supply and revenue; "which," as Mr. Gladstone said, "we knew the Lords would not dare to throw out." The Republican party could find the way quickly enough to repeal our own "tax on intelligence," as Mr. Gladstone termed it, did its masters only permit. But those protected interests which cowed the valiant President Roosevelt into suppressing his tariff reform message are the persons whose word is law—not their puppets in Congress.

So far as the Paper Trust is concerned, the Department of Justice, if it conducts its investigation with care, will, we believe, find much of interest besides recent disregard of a Federal Court's orders. The Trust asserts that it owns only two Canadian mills, but a reputable Boston publisher who tried lately to obtain his supply from Canada suddenly found that, after he had made all arrangements, the mill was unable to do the work. Subsequently, an agent of the Trust appeared in his office and recounted to him every step in his negotiations with the Canadian mill, and then laughed at his failure to break away from the Trust.

On the other hand, the International Paper Company insists that the raising of prices is due to the growing scarcity of material. Its net earnings have steadily decreased from $2,138,117.31 in 1905 to $1,985,540.96 in 1906 and $1,623.616.48 in 1907. Furthermore, it has been forced to sell six million dollars' worth of bonds during the last four years to provide for new timber lands, pay for alterations, renewals, etc. The stockholders, therefore, cannot be said to profit by the increased price of the product.

But, in spite of this plea of poverty, the fact seems to be that the Trust is dumping paper abroad at a lower figure than it obtains here. After the Trust was organized, our exports of paper were doubled within three years. The value of the exports in 1906 was $9,536,-065, and the paper was sold in England at less than two cents per pound, as compared with something less than three cents in this country. If the scarcity of wood-pulp is the real reason for the rise in price, the Trust ought to be the first to ask for a lowering of the duty, for there is abundant wood for pulp in Nova Scotia and Newfoundland. And, quite aside from the question of paper, the senseless deforestation of much of this country has made all lumber scarce and costly. Hence, if the Republican party were really as concerned for the pocket of the workingman as it pretends to be for the condition of his dinner pail, it would make the repeal of the tariff on lumber a matter second only in importance to a readjustment of our inflexible currency. From one point of view, the sufferings of the publishers may accomplish some good. President Hayes used to tell the story of how the tragic recapture of a slave in the street in which he lived had made of every man in it a foe of slavery. "Hereafter, Mr. Hayes," said one of his pro-slavery neighbors, "I shall be not only a black Republican, but a *damned Abolitionist*." We hope that, so far as the tariff is concerned, the present object-lesson will make all newspaper publishers damned abolitionists.

FRANCHISE BARGAINING.

It is an interesting fact that the realization of what a city is able to obtain by skilful bargaining with a public-service corporation has come about during the very years when the advocates of complete municipalization have been most eloquent over the peculiar advantages of their own plan. The results that have actually been secured by negotiation are on record for the guidance of the cities which sooner or later will have to approach the same questions. Though it is too early to attempt a final judgment, recent experience teaches that the average municipality is in a much better position for dealing with its public utilities than was formerly supposed.

No party to a bargain or a controversy could possibly have made a worse start in this respect than did the average city. Municipal ownership advocates are in the habit of speaking rather disrespectfully of the United States Supreme Court's decision in the Dartmouth College case, on which franchise properties are so largely based. "Reasonable legislation," says Frederick C. Howe in one of his books, "would have created a license, revocable at the will of the granting authority, but subject to compensation by the community for the actual investment made by the company. Such is the title enjoyed by other wealth." Be that as it may, "reasonable legislation" had extremely little to do with the early treatment of public-service companies. Some most enlightened franchise ordinances were passed at very early dates, to be sure. The first franchise ever granted in Chicago, for example, safeguarded the city's interests so well that no capitalist ever built a road under it. But, in general, where the desire of a community to get the benefit of the new and wonderful urban conveniences would not give the exploiters of these conveniences what they wanted, bribery would. This method of corruption did more than create powerful material monopolies; it created an attitude of mind on both sides unfavorable to the public interest. It was expressed in the attitude of a street-railroad official who once remarked that "the first man who accepted a limited franchise deserved to be shot."

Yet, as it has turned out, the possession of long-term or even perpetual franchises does not make a corporation invulnerable. So long as communities grow, neighborhoods change, and invention progresses, public-service corporations have to seek new licenses and privileges, and every application for extension or modification of the old conditions is a weapon in the city's hands. Perhaps a traction company wants to lay its tracks across a new bridge, or an electric company to build new conduits. A city often can make a better bargain by securing favorable changes in former grants than by exacting compensation in money. There have even been cases, we believe, in which companies that had secured perpetual, irrevocable franchises in horse-car and cable days, could have been made to capitulate before being allowed to use electric power.

Concrete instances of recent date show the great strategic importance, so to put it, of these supplementary or expiring grants. Chicago contended for years against traction companies to which the Illinois Legislature had granted in 1865 ninety-nine-year extensions of all franchises. The city never recognized the validity of the act, but even when the companies were insisting most stoutly on their rights, no one supposed for a moment that, because of them, a settlement of the burning question was to be deferred till 1964. The city made the relinquishment of these ninety-nine-year rights a condition in each of the many solutions proposed from the mayoralty of the first Carter Harrison to that of Dunne. Though in the end these always dubious rights were disposed of by a Supreme Court decision, there is no practical doubt that the companies would have had to waive them soon in any event, if the city continued firm. Cleveland, at the present time, illustrates the same condition. There the old company, with absolutely unassailable 5-cent-fare franchises on three-quarters of its lines, with from ten to twenty years still to run, was ready to surrender all of them if it could get a new twenty-year franchise that would keep its system complete even at a 3½-cent fare. Detroit and some other Western cities, we believe, have secured almost as favorable arrangements for themselves by making their companies bid for privileges which, if not absolutely indispensable, were at least extremely important to the operation of their systems.

Allusion has been made above to the unfortunate atmosphere that used to surround all franchise discussions. The

corporations' own sublime belief in their right to extraordinary and continued privileges communicated itself to some extent throughout our society. It helped to make ordinary citizens indifferent, and officials complaisant and venal. Even the most casual observer must have noticed the change in the attitude of both the corporations and the public. The Chicago telephone franchise, for example, is regarded as more favorable to subscribers than any other in the country. It provides for an amount of public regulation that would have been looked upon as remarkable a few years ago. Yet even that franchise is under attack now on the ground that it was practically drawn by the company itself, and that the city ought to have done better still. The same point was made in Cleveland. Mr. Burton was attacked as the traction company's candidate, though his programme would have brought the city better terms than any other has to-day. Mayor Johnson expects to get still better conditions within a month. Nor are Cleveland, Detroit, and Chicago in possession of any magical secrets for corporation taming. Though they began better than New York or Philadelphia, they have only been using in these later stages of development the advantages which time will put in the hands of every city.

THE THIRD DUMA.

The results of the Russian elections, which are now nearly completed, show, on the face of the returns, an almost absolute majority for the Reactionaries in the new Duma. So confident are the Monarchist, or True Russian leaders, as they call themselves, or the Black Hundred, as they continue to be called by their opponents, that they have publicly announced their intention of proceeding to St. Petersburg, merely to aid a benevolent Czar in tiding over the present crisis, and then to bring about their own permanent dissolution, leaving Holy Russia safe at rest once more under the cherishing wing of the autocracy. The Empire has evidently travelled fast and far in the two years since the publication of the October manifesto, which gave to Russia its "Constitution." At that time the world saw an absolutist government in full panic, a people roused to the wildest expectations of political and social reform, the bureaucracy more than ready to go over to the masses, the nationalities within the Empire advancing more or less openly bold projects of autonomy or separation—Russia, in short, passing inevitably, it seemed, into revolution and dissolution. To-day, reaction feels itself firmly seated in the saddle, quite free from panic, audacious enough openly to violate its solemn pledges, and seemingly preparing, with supreme irony, to turn the Duma, created as an instrument for the regeneration of Russia, into a weapon for Russia's undoing.

This is the obviously dark side of the situation. The optimist, to make out his case, would argue somewhat on the following lines: The ascendency of the absolutist party in the new Duma is by no means a determined fact. The Reactionaries do not quite number one-half of the total membership, and they may be held in check by a combination of the two other great parties, the Octobrists, or Moderate Right, and the Constitutional Democrats; the Left is regarded as insignificant in the third Duma. Such a combination between the two parties which stand for the maintenance of the rights acquired under the Constitution of October 30, 1905, may possibly be brought about by the very excesses of the reactionary element; that something like coalition against the absolutists is already under way is reported in recent dispatches. In addition, it is the fact that most of the statesmanship and eloquence in the coming Duma will be found on the side of the anti-absolutists. The Octobrists and the Constitutional Democrats have succeeded in returning some of their most prominent leaders in the previous parliaments, and a notable gain is to be recorded in the election of Mr. Milyukoff, the virtual leader of the Constitutional Democrats, whom the government kept out of the first and second Dumas. Mr. Milyukoff's talent for organizing parliamentary majorities may again come into play, and a "Constitutional" *bloc* obtain control of the Duma.

But even if a fairly Liberal majority should get the upper hand, the question still remains, What can the new Duma hope to accomplish? That it will once more attempt to deal with the great problems which brought about the two former dissolutions is quite improbable. Political amnesty, ministerial responsibility, a thoroughgoing agrarian law—on these the government spoke with finality when it was faced by hostile radical Dumas; and, naturally, it will not bear contradiction now when it has the power. The Duma, at the present time, is in a position to do only what the government will allow. Should the autocracy decide upon sweeping aside all remnants of the Constitution by formally abolishing the Duma, it is strong enough, for the present, to do so. It need not fear an increase of resentment among the ranks of the radical masses, because there the government's course up to now has already created a maximum of irreconcilable hatred.

That the Czar and his ministers, however, will not go to the extreme of abolishing the Duma, is a practical certainty; for a distinction must be drawn, to some extent, between the government and its mob of fanatical supporters in the new Duma. The latter, like every parliamentary mob chosen in a period of reaction, is anxious only to please the powers in control, by foaming loyalty at the mouth, oblivious of consequences beyond a single parliamentary session. A government, even if it be the Russian government, cannot but have an eye to the near future, and that future is by no means an unclouded one for the autocracy. The Czar's government, therefore, now that it has a Duma it can control, will most probably allow it to perform the strictly salutary functions of "adviser" to an omnipotent autocracy, a function contemplated in the original manifesto of August 19, 1905.

What can the Liberal parties, under such circumstances, hope to accomplish? The Constitutional Democrats will probably decide to swallow the bitter pill, to accept the inevitable, and set to work to save what can be saved out of the wreck of Constitutional rights, in the hope of winning back little by little that complete charter of liberties which Russia enjoyed for two or three days after the thirtieth of October of two years ago. But a conciliatory policy on the part of the Constitutional Democrats would be more than playing for small concessions; it would be gaining time and opportunity for the recuperation of the working classes, whose efforts during the last two years have exhausted them, but without whose active participation, events have shown, there can be no real progress in Russia. The revolutionary leaders must reorganize their scattered forces, reëstablish discipline, and gather munitions of war before another upheaval like that of 1905 can be expected. Till then the Liberals in the Duma, acting as a rearguard, will probably try to save what they can out of the rout.

POPULARIZING THE BIBLE.

In the present effort to quicken interest in the Bible and increase the number of its readers, the argument commonly advanced is that the Bible is very entertaining. This, indeed, is the inference from the title of Senator Beveridge's last book, "The Bible as Good Reading." A generation or two ago there was no attempt to sugar-coat the pill. The Bible was the Bible, the inspired word of God and the one key to Heaven. Thus it was that children of five sat down dutifully to their chapter a day—long or short, rain or shine. The question whether you enjoyed the Bible was entirely irrelevant; you were not expected to enjoy it. The reading was as inevitable a part of daily routine as going to school, chopping kindlings, or washing your face. But as the dogma of verbal inspiration has lost its hold, as the belief has spread that the future of your immortal soul does not depend directly upon your knowledge of

the Bible, and as learned critics have advanced the opinion that the Bible is merely one of many edifying books, the impelling motive for reading it has weakened. It must take its chances in competition with thousands of other more or less attractive books, with the newspapers and the illustrated magazines. These causes, we take it, fairly explain that deepening ignorance of the Bible which clergymen and also teachers of English so loudly lament.

To be sure, the higher critics eagerly assure us that the Bible contains some of the best literature in the world. This is the view which Matthew Arnold urged more than thirty years ago in "Literature and Dogma." Rejecting much of the current theology of his day, he maintained that the Bible must be approached from the point of view of culture. He insisted, as he says, on "the case for letters"; for by this means, he thought, "much fruit may be got out of the Bible." And this has been the attitude of many later writers. But, unfortunately, you cannot persuade people that culture will save them from the pains of hell; and thus it is that millions of amiable men and women care nothing about culture, and calmly neglect the Bible and all other great masterpieces of literature in order to read the last popular novel, the "storyettes" in the monthlies, and the vulgarities of the Sunday newspapers. Then, too, the Bible, regarded merely as literature, has suffered because many people have practically held to that motto which Mr. Arnold described as so ingeniously absurd, "The Bible, the whole Bible, and nothing but the Bible!" We have handed the whole Bible to our children, told them that it contains the most entertaining stories, like those about Joseph and his brethren and about Samson, and have then been surprised to see the book laid aside in half an hour. The truth is that, compared with the total bulk of the Bible, the amount of matter that is entertaining to the average child is relatively small; and the amount that is of the highest literary value is also small. A child cannot read the Bible for an hour without running upon some pretty dull passages; and adults who do not read primarily for religious instruction agree in testifying that the Bible can be enjoyed only by one who knows how to skip.

The case of the children was long ago recognized by publishers of books in which the Bible stories are retold—often in words of one syllable. But to read those was not to read the Bible itself; and the literary style of these books was often extremely crude. A distinct improvement on this method was shown in the volume entitled "The Bible for Children," arranged from the King James Version by Mrs. Joseph B. Gilder, and published by the Century Company in 1902. In the introduction to this excellent anthology Bishop Potter himself says:

> Not all of the Bible is of equal worth and pertinency; not all of it is of equal interest or utility. The old tradition that to read it through, mechanically and indiscriminatingly, two or three times a year, had of itself some occult and mysterious potency, has come to be recognized as belonging to the kindred tradition that soldiers' lives have been saved by a New Testament carried in the left breast pocket, because it was a Testament; whereas any other volume carried in the same place would have stopped the bullet quite as effectually.

Of course, the notion of making anthologies of this kind is not exactly new. The Psalms, the Epistles, and the Gospels in the Book of Common Prayer form a small but admirable anthology. The American Bible Society itself has printed in separate volumes not only the New Testament, but the Psalms and other portions for which there is special demand. But the importance, indeed the necessity, of presenting the Bible by selections is, we are glad to observe, becoming more generally understood. This autumn, for example, we have two volumes in apparent response to a growing demand: "The Soul of the Bible," made up of passages chosen by Ulysses G. B. Pierce, and published by the American Unitarian Association; and "The Literary Man's Bible" (Chapman & Hall), prepared by W. L. Courtney, editor of the *Fortnightly Review*. Mr. Courtney, in his preface, frankly avows the purpose of securing for the literary parts of the Bible a heartier appreciation:

> When so many people seemed to imagine that the Bible had nothing to do with literature, it appeared to me not an unprofitable task to attempt to prove that the Bible contains literary elements of priceless merit.

To such treatment the Bible lends itself admirably. It is not a unit: it is a collection of Hebrew prose and poetry; and the most pious and orthodox Christian cannot object to a volume of selections which shall give wider currency to the best of it.

For the shortcomings of the rising generation in Biblical knowledge are a topic of perennial discussion, here and in England. France, too, echoes the complaint. Not long ago, in *Figaro*, Marcel Prévost complained in an *obiter dictum* that "the children of the primary school to-day no longer learn the sacred history; they are ignorant for the most part of the beautiful story of Joseph sold by his brethren, of the Queen of Sheba, and of the war of the Maccabees." With that sentence as text, E. M. de Vogüé has written for *Figaro* a leading article in which he points out that the philosophies, the literatures, the arts, and the languages themselves of Western civilization have been nourished (*alimenté*) in large part from the Bible. The Biblical tradition impregnates all our fashions of thinking and speaking. A man totally unacquainted with the sacred history would go through the world as if deaf or blind. A people which loses familiarity with the Bible is exiled from its spiritual and intellectual fatherland, and becomes a tribe of outlaws. To these sentiments men of all creeds or no creed can subscribe. All inheritors of that great treasure, the King James Version, must welcome any anthology that may make the vital parts of it more accessible and popular.

DRAMATIC CENSORSHIP AGAIN.

A storm that has been brewing for some time seems likely to break soon upon the devoted head of George Alexander Redford, the British dramatic censor, or, to give him his legal title, Examiner of Plays. A committee of dramatists, belonging chiefly to what is generally but rather vaguely described as the advanced school, and other interested persons, is in process of formation, with a view to securing either the abolition of his office or a limitation of its authority. It is to be noted, however, that the movement, though not uninfluential, appears to be founded upon a sense of private injury, rather than upon any general public demand.

The immediate cause of it is the veto which Mr. Redford has put upon the production of two plays, one, "The Breaking Point," by Edward Garnett, son of the late Dr. Richard Garnett, of British Museum fame, and the other, "Waste," by Granville Barker, one of the most active and successful champions of the intellectual and imaginative theatre. Of the latter piece not much is yet publicly known, but Mr. Garnett's play has been published, and few unprejudiced readers will deem its exclusion from the stage an outrage. It is not immoral, but it is uselessly and unnecessarily crude in its references, unpleasant and improbable in its theme, and unnatural in its treatment. In this one instance, then, the censor can make out a good case in his own defence. He has not burked a masterpiece or eclipsed the gayety of nations, but the justice or injustice of a single decision on his part is, of course, an insignificant matter compared with the general question of the utility, the necessity, or the extent of his jurisdiction. And now that the English-speaking theatre, owing to the syndicate system, is rapidly becoming an international institution, the question is one that is not without interest on this side of the Atlantic.

Mr. Garnett, who is organizing the assault upon the censor, bases his indictment upon several "axioms." Among them are the following: (1) That it is not his function to suppress works of art, (2) that his sole function is to pre-

vent "gross or prurient indecency," (3) that it is not his business to suppress intellectual plays criticising contemporary life or introducing new moral teaching. There are others, but these three will suffice; and, if the second is sound, manifestly two of them are superfluous. The first point to decide is what constitutes gross and prurient indecency. If this phrase is to be construed exactly, it can only mean acted obscenity, and that is a matter amply provided for by police regulations, and no specially qualified censor is needed. But the real danger to be guarded against, of course, is veiled indecency, the artful suggestion that puts a gloss upon vice, disguises vile and morbid passion in specious and alluring form, confuses right and wrong, and, under the pretence of serving truth or revealing beauty, panders to the lower instincts.

Nobody can deny that there is a large amount of such insidious poison in the modern European drama, or assert that it is either profitable or healthful for a mixed audience. Whether it might be instructive and inspiring to an assemblage of assorted specialists is another matter. To the young of both sexes, it is beyond all question highly demoralizing. The question then arises whether it is wiser, in a community which professes to set some store upon training and example, to give dramatists a free hand in dealing with such material, without reference either to manner or motive, expecting the consumers to provide their own antidote, or to subject them to some sort of regulation. If the latter plan be adopted, it is clear that the regulating authority ought to be endowed with a much larger share of wisdom and discretion than could reasonably be looked for in the average police officer. It is upon this theory, presumably, that the British censorship is still maintained, now that the original political significance of the office has practically disappeared.

That some kind of theatrical supervision and control is desirable, in the interests of literary and dramatic art, as well as of good morals, most reflecting persons will agree. The great difficulty lies in the selection of a competent tribunal, one that could not be suspected of bigotry, prejudice, favoritism, prudery, or excessive liberality. That the public feel instinctively the need of some such institution is possibly shown by the development of the unofficial guild of dramatic critics. These gentlemen might constitute a potent censorship, if their numbers, and the lack of recognized standards, did not preclude the possibility of their agreement. Experience seems to prove that the only practical censorship must consist of one man, or a very small commission. With us, the problem would be to keep it free from political and other malign influences; but there would be an abundance of work for it to do, if only in the suppression of the host of cheap and pestilential melodramas with which the whole country is overrun, and the posters of which are often a disgrace to our civilization.

Against Mr. Redford's integrity there has been no breath of suspicion. Only his judgment is impugned. Doubtless, he has made some mistakes, but he will not lack for sympathizers in his view that Tolstoy's "Powers of Darkness," Ibsen's "Ghosts," Brieux's "Maternité," Bernard Shaw's "Mrs. Warren's Profession," and "The Breaking Point," however benevolent they may be in purpose, contain matter that is unsuitable for popular entertainment. Mr. Garnett and some of his associates are quite sincere, doubtless, in their indignation and protestations; but there is a vast amount of hypocrisy beneath the pretended zeal of many of the advocates of the advanced drama. It is the prospect of financial gain, rather than any worship of art or intellect, that is too often the true incentive. There is a market for the abnormal and the lewd. Mr. Redford has been fighting honestly and courageously, if not always wisely, in behalf of that decent reticence which is an essential characteristic of the best art and good manners. Unfortunately, he cannot kill a rank play without advertising it—a fact of which American managers take prompt advantage. But if his censorship is ineffective here, that is not his fault.

A DISCOVERY OF JEWISH REMAINS IN EGYPT.

PARIS, November 1.

Prof. Charles Clermont-Ganneau, of the Collège de France, publishes a lengthy description of the striking results of recent excavations in the island of Elephantine. They prove the existence of a Jewish temple of Jehovah in that place under the twenty-seventh dynasty (from Persia), with remains from the reigns of Xerxes, Artaxerxes, Darius Nothus, and the second Artaxerxes. They furnish names already known from the Bible, and one mentioned by Josephus.

It will be remembered that M. Clermont-Ganneau's career in Semitic epigraphy began with his discovery of the Moabite Stone in 1870, when he was dragoman of the French consulate at Jerusalem. In spite of the opposition of Semitic scholars of the old school, and of certain hasty conclusions of his own, his wide knowledge of Semitic remains and inscriptions, and his detection of recurring archæological frauds won for him final recognition. The French government and university long since bestowed on him their confidence and highest honors. Several years ago he came into conflict with the authorized scholarship of the day concerning the precise epoch of the ten or so Aramæan texts, which so far comprised all that had been discovered of Semitic origin in the papyrus fragments. These were commonly attributed to the Greek period of the Ptolemies. M. Clermont-Ganneau placed them much farther back—during the Persian domination over Egypt. His conjecture was verified by successive discoveries of other Aramæan inscriptions explicitly dated from the years of the Persian reigns. A final papyrus (of the Strasburg library) proved under his skilful interpretation, where the German, Prof. Julius Euting, had failed, to be a petition of non-Egyptians against the priests of the god Chnemu of Elephantine. With his usual alertness M. Clermont-Ganneau decided that the petitioners must have been Jews of the exile; but he was unable to obtain government aid to verify his guess by new excavations.

In 1904 the natives, while extracting ammoniacal earth from the ruins, came on ten still perfect papyrus rolls, which were afterwards published by A. E. Cowley of Oxford. These consisted of notarial acts concerning Jewish inhabitants of Elephantine and the city of Syene, with concordant dates of the Aramæan and Egyptian calendars for a period of sixty years (between 470 and 410 B. C.). The oaths were in the name of Jehovah, God of Israel, and —what was most surprising—his sanctuary was shown not to be a mere synagogue, but a veritable temple with sacrifices quite as in the now ruined, but still exclusive temple of Jerusalem. "This was enough to make, perhaps did make Jeremiah howl," says M. Clermont-Ganneau. Thus accredited, he was sent last year by the Académie des Inscriptions on a mission of scientific excavation.

During four months, beginning with November, 1906, aided by M. Clédat, his oldest pupil, he used the funds supplied by Edmond de Rothschild in searching for this Jewish temple. A German mission had already preoccupied the greater part of the ground. A happy chance, in the part of the island which was left to them, directed the French diggers, after more than two months with none but Greek and Egyptian finds, to the very heart of the Jewish quarter. They soon came on quantities of ostraca bearing Aramæan inscriptions on both sides. These have not yet been completely deciphered; but enough is already known to disclose that they are of the same time, writing, and language as the previous papyrus. They contain among other matters of daily life a quite new form of the name Jehovah. The French excavations were stopped by the heat in April last, but are now to be renewed with the firm determination to resolve this mystery of the unknown temple.

Meanwhile, Herr Rubensohn of the German mission had found new papyrus fragments with important Aramæan inscriptions, of three of which a first interpretation has just been made by Prof. Eduard Sachau of Berlin. The first more than confirms all the conjectures of M. Clermont-Ganneau and starts up any number of questions in Jewish history and religion. It is a petition, dated from the seventeenth year of the reign of Darius Nothus, and addressed to Bagohi (the Bogoas of Josephus), Persian governor of Jerusalem, by Jedoniah and his fellow priests of Elephantine. It complains that their temple, built by their fathers to the "God of heaven," had been pillaged and destroyed by the manœuvres of the priests of the god Chnemu. Even Cambyses, they say, respected this temple when he de-

stroyed those of the Egyptians. It was of cut stone, with seven monumental doors, stone columns and a cedar roof; and the sacred vessels were of gold and silver. Reference is made to a previous petition, which had also been sent to Yehohanan (Johanan), high priest at Jerusalem, to his brother Ostan Anani (Hanani), and separately to the sons of Sanaballat, governor of Samaria. These names, with that of Shelemiah, occur in the book of Nehemiah. The third papyrus shows that the petition for rebuilding their temple had been granted.

Prof. Clermont-Ganneau, with the vivacity which age and controversy have not quenched, adds:

Who knows? Our picks may yet discover, laid away in some secret "geniza," a copy of the sacred book which was used in the ceremonies of worship—a Bible anterior by five centuries to Jesus Christ!

S. D.

NEWS FOR BIBLIOPHILES.

Led by personal interest first incited by a visit to the Bermudas and his own efforts to trace material printed about them, George Watson Cole has for several years been contributing to the *Bulletin of Bibliography* a series of Notes on Bermuda Bibliography. These have now been reprinted "for the author" under the title "Bermuda in Periodical Literature," a well-made book of nearly three hundred pages. The editor points out in his Preface that by far the larger part of what has been written concerning Bermuda has appeared in periodicals or in transactions of learned societies; and, while the 1382 items recorded include a number of books, most of them relate to such scattered articles. Mr. Cole's work is much more than would be expected from the title. Almost every entry is followed by a note of explanation or an extract from the article itself, and some of these are interesting reading. The Index is elaborate, and contains authors' names, places, and scientific and common names of plants and animals. Three hundred and fifty copies have been printed, of which fifty are on large paper. The volume is illustrated with facsimiles of title-pages of eight of the earliest and rarest books referring to Bermuda, and a photogravure portrait of the author.

Albert Matthews has been making a careful study of early Boston newspapers, and the result of his investigations, published by the Colonial Society of Massachusetts as the third part of its important check-list and collations of issues, has also been issued separately with the title "Bibliographical Notes on Boston Newspapers 1704-1780." It is filled with interesting notes and extracts. The first attempt at a newspaper to be printed in America was a sheet, which appeared in Boston in the autumn of 1690, having the title *Publick Occurrences Both Foreign and Domestick.* It was immediately suppressed by the authorities, only one number, that for September 25, being issued, and of that number the only specimen known is in the Public Record Office, London. The next attempt was more successful: the *Boston News-Letter* began April 24, 1704, and lasted with frequent change of name and of publisher until 1769. Its first publisher was John Campbell, postmaster of Boston; and it is a curious fact that for fifty years, 1704 to 1754, every postmaster of the city was also the publisher of a newspaper. The second Boston newspaper, the Boston *Gazette,* was begun in 1719, by William Brooker, Campbell's successor in the post office. The third Boston newspaper, the *New England Courant,* is of more interest, on account of Benjamin Franklin's connection with it. Its publication was begun by James Franklin on August 7, 1721. Owing to its frequent criticism of government affairs and freedom of speech on religious and other subjects, the General Court ordered in January, 1723, that James Franklin "be strictly forbidden . . . to Print or Publish the *New England Courant* or any Pamphlet or Paper of the Like Nature, except it be first supervised by the Secretary of this Province." The number for February 11, 1723, contained a notice beginning:

The late publisher of this Paper, finding so many inconveniences would arise by his carrying the Manuscripts and public News to be supervis'd by the Secretary, as to render his carrying it on unprofitable, has intierely dropt the Undertaking. The present Publisher having receiv'd the following Piece, etc.

The "Present Publisher" was Benjamin Franklin, James's younger brother, then a boy of seventeen; and the paper appeared over his name for several months, or until he ran away to New York and Philadelphia. Mr. Matthews's summary shows that between 1704 and 1780 no less than 13,680 issues of various newspapers appeared in Boston. Of about 10 per cent. of these no copies are now known to exist. Of the others almost all are to be found in one or another of the great Boston libraries (the Public, the Massachusetts Historical Society, and the Athenæum), or in the library of the American Antiquarian Society at Worcester. But of some numbers the only known copies are in the Lenox or New York Historical Society libraries in New York or in the library of the State Historical Society of Wisconsin, which is especially rich in files of colonial newspapers.

Reports have been received by cable of the prices paid for some of the rarest items of Americana in the sale of the books of the Earl of Sheffield at Sotheby's in London, November 4 and 5. Daniel Denton's "Brief Description of New-York, formerly called New-Netherlands," 1670, a fine copy with the date, brought £350. The record is £400, paid for Lord Ashburton's copy in 1900. Edward Winslow's "Good Newes from New England," 1624, brought £250 (the Ashburton copy, £240 in 1900); and Higginson's "New England's Plantation," 1630, the second edition, but containing more matter than the first, published the same year, £100. "A True Relation of the late Battell fought in New England, between the English and the Pequet Salvages," by Philip Vincent, 1638, the second edition, went for £83; and Underhill's "Newes from America," 1638, the second of the contemporary printed accounts of the Pequot war, a fine copy, with the rare folding "figure of the Indian Fort or Palizado," £245. We know of no previous sale at auction of a copy with the plan. A pamphlet of four leaves, "Strange News from Virginia; being a full and true account of the Life and Death of Nathaniel Bacon," 1677, was bid up to £99.

Correspondence.

WORDSWORTH AND GAY.

To the Editor of The Nation:

Sir: One of the cardinal principles of Wordsworth's poetical creed was detestation of the poets who looked to Pope as master. Of these none stood closer to Pope than John Gay. This fact may lend interest to the following literary parallel.

In Wordsworth's "To a Skylark," published in 1827, occur the following lines (3-6):

Or, while the wings aspire, are heart and eye
Both with thy nest upon the dewy ground?
Thy nest which thou canst *drop into* at will,
Those quivering wings composed, that music still!

A hundred years earlier, in Gay's well-known ballad, "Sweet William's Farewell to Black-eyed Susan," stanza iii. contains the following lines:

So the sweet lark, high-poised in air,
Shuts close his pinions to his breast
(If, chance, his mate's shrill call he hear),
And *drops at once into her nest.*

The verbal correspondence may be only a coincidence; but Gay's description of the lark certainly shows "the eye on the object" quite as surely as does Wordsworth's.

Frank H. Chase.

Beloit College, October 26.

THE "PUBLIUS" LETTERS ATTACKING SAMUEL CHASE.

To the Editor of The Nation:

Sir: More than twenty years ago (in 1886) I pointed out that the letters of Hamilton, signed "Publius" and printed in 1778, were directed against Samuel Chase, a member of the Continental Congress from Maryland, who had used information gained in Congress to speculate on the army's need for flour. The evidence on this matter was summarized in the New York *Evening Post,* November 1, 1886. Bernard C. Steiner, in his "Life and Correspondence of James McHenry" (Burrows Bros. Co.), gives a foot-note to the effect that in January, 1782, McHenry wrote to Hamilton and Edward Giles "refusing to tell the name of Publius, but adding that he would send Publius, who is not an inhabitant of the State, the proceedings of the House of Delegates in the case of Cadwalader against Chase, and will tell Publius's name only in case he is willing to retract." But Mr. Steiner apparently was not aware of the identity of Publius, or of the controversy involved. I have just found in the Hamilton manuscripts a draft of a letter, evidently written to McHenry, and adding one more item to the history of this abuse of his position by a member of Congress. This draft must have been known to the editors of Hamilton's writings, but was omitted because of the difficulty of knowing who C——e represented. Now that the occasion of the letter is known, it becomes an interesting and characteristic expression of feeling on the part of Hamilton.

Worthington C. Ford.

Washington, November 1.

I am much obliged to you for the papers you transmitted me on the subject of Mr. C——c. Nothing gives me greater pleasure

on all occasions than to see suspected and injured innocence vindicated, nor would any person more chearfully retract an ill-founded accusation, on conviction of its error, than myself. You know the motives and the grounds of my charges against Mr. C——e, at a period fertile in practices as pernicious as basc. You know that *I can have no* personal enmity for him, and that considcrations of public good alone dictated my attack upon his conduct and character, influencod by a persuasion produced by the strongest authorities, that he was acting a part inconsistent with patriotism or honor. You are not less convinced, that if the evidence of his innocence ballanced in my mind that of his guilt, I could not refuse it to my own feelings, to make him the most explicit and complete retribution. But hitherto, it is impossible that this can be the case. My witness, one of them is entirely out of my reach, the other too remote to enable me to have yet known what he may have to oppose to the late transactions in Mr. C——e's favour. The informations of both were too positive, their characters are too respectable to permit me lightly to relinquish the impressions of their testimony. I have too often seen public assemblies acquit guilt from prepossession, party spirit, want of formality or certainty (though there has been the greatest probability) in the evidence, to allow myself to regard the determination of your's as conclusive. I respect however the decision of such a body too much not to be induced by it to *doubt* and *examine*. This I shall do and govern myself by the result.

As to the discovery of my name, demanded with such preposterous vehemence, by a volunteer in the dispute, I conceive myself under no obligation to make it; especially to a person uninterested in the matter. I have esteemed Major Giles's character, and am sorry for his sake that he has so indelicately entered the lists; and made himself, not only the champion of Mr. Ch—e's innocence in the present case, but of his virtues in general, certainly at best equivocal, in spite of the Major's panygerics. He should have recollected, that by an alliance with his family, he did not ally himself with his principles; and that he degrades Mr. Ch—e, as well as commits himself by unnecessarily taking up the glove for him. I attribute it however to an imprudent generosity of temper, and forbear any strictures that may wound him. You, sir, who are acquainted with me must be convinced that an apprehension of his, or any man's resentment is a motive incapable of operating upon me, or having the least share either in the concealment of my name or in the moderate return I make to his invictives.

I have the honor, &c.

Feby. 26, '82.

THE REPUBLICATION OF OLMSTED.

To the Editor of The Nation:

Sir: Notice of the republication of Mr. Olmsted's books, written before the war, on the condition of the slave States, lately appeared in the *Nation*. Remembering the interest excited by their first appearance fifty years ago, I have taken up and reread his "Seaboard Slave States." Indeed, I found it difficult to lay the book down until I had finished it. What a picture of States founded on slavery! Republication cannot but enable us to mark more clearly than at present the advances made under freedom, and to discount the opinions of those who even still strive to represent the relations of master and slave, as the only wise ones to subsist between the white and negro races. How interesting it would be if some capable writer as honest and fair-minded as Olmsted followed his wanderings, and enabled us actually to compare the present with the past. It might, indeed, pay an enterprising publisher to commission some competent person to the task.

Alfred Webb.

Dublin, October 28.

FRATERNITIES IN THE SMALL COLLEGE.

To the Editor of The Nation:

Sir: The proposal of President Wilson to substitute residential quadrangles for the familiar clubs at Princeton, calls attention once more to the recurring problem of the organization of undergraduate social life in American colleges. In spite of captious critics, it does not appear that those small colleges which have clung so tenaciously to the Greek letter fraternities have after all fared worse than those larger institutions, which in their wisdom abolished fraternities—and left the recalcitrant undergraduates to recombine in so-called dining clubs. Given the American youth and the American college with its strong insistence upon "all-round manhood" rather than scholarship, some sort of social grouping is inevitable. Now that the storms that beat upon college fraternities a quarter of a century ago have subsided, it is possible to measure with some degree of impartiality their worth or worthlessness. Not the least remarkable aspect of the present situation in those small colleges where fraternities have stood their ground, is the absence of the old town versus gown feeling. Nearly a score of years ago, the writer attended a town meeting in a college town in western Massachusetts, in which discussion turned upon a certain new chapter house. An irate citizen whose land abutted upon the fraternity grounds, and who had unpleasant prepossessions about his new neighbors, exclaimed, "I tell ye, I'd as soon have a nest of skunks in my cellar." It is the almost universal testimony of the older inhabitants of at least one old college town in New England, that the traces of original sin in the present undergraduate are far less conspicuous than before the régime of the chapter house. There is, indeed, strong reason to believe that the fraternities should be credited with some part in this regenerative process.

Among the older New England institutions, Bowdoin College presents an interesting example of the functioning of fraternities in the undergraduate life, since all but 9 per cent. of the students are members of one or another of the eight societies. All the fraternities now possess comfortable chapter houses, which occupy some of the most desirable sites in town. Their total valuation is put at $73,000, which yields the town taxes to the amount of $1,500. This, in a town which places a valuation of only about $3,600,000 upon all of its taxable property, is a very considerable sum. Ownership of property, with its attendant responsibilities, has unquestionably heightened the sense of corporate responsibility in the undergraduate members of these fraternities. So long as the student was an irresponsible tenant in a dreary dormitory he exhibited no concern about the property of either college or townspeople. Happy the householder who could keep a front gate on its hinges when the bonfires of victory were lighted. As landlord, the student views depredations upon private property with far different eyes. As a member of the commonalty, he has developed a rudimentary social consciousness.

Fraternity pride has contributed also to the social education of the undergraduate. A wholesome inter-fraternity rivalry has created conventional penalties for the particular society which sins. The consciousness that the fraternity may suffer from individual wrongdoing, is often an excellent deterrent. A wise administration has more than once made use of this *esprit de corps* to discipline flagrant offenders. Indeed, there have been instances where the fraternity has rendered most effective service to the college by itself taking the initiative in matters of social reform. Like the Anglo-Saxon *tithing*, the fraternity is in a sense pledged to the keeping of the peace.

Those who live in the immediate presence of fraternities and who witness daily and hourly the boyish, careless, undergraduate life, must needs shut their eyes to many on-goings, if these complacent reflections are not to be proved suppositions contrary to fact. The history of college fraternities is a series of lapses from grace, and of buoyant recoveries. The comforting and convincing fact is that recovery surely comes. In the long run, loyal alumni can be counted upon to apply the needed corrective, when a local chapter loses its standing.

But above all else, the fraternity stands for a phase of education which is often too lightly valued. It is the testimony of a mature observer, for many years a teacher in a technical school of national repute, that, other things being equal, the college graduate who comes to his technical courses comparatively late will, in the end, outstrip his schoolmate who lacks the academic training, in competition for positions requiring administrative talent. American society has come to put a high premium upon this peculiar talent. The ability to achieve desired ends, by sound judgment in the employment of human agents, may be a congenital gift, but it is surely fostered and brought to ripe maturity by contact with men. Membership in a college fraternity has often drawn men out of themselves, forced them to take the measure of their associates, and thrust responsibilities upon them. There is no better school for temper than the constant attrition which results from the close contacts within fraternities. Through his fraternity, if at all, the bookish youth is brought into touch with realities; in the give and take of intimate friendship, he may achieve self-mastery.

That there are real dangers from this remarkable growth of fraternities in the small college, no one will deny; but they are of a different sort from those which haunt the minds of parents. A not unfriendly critic once remarked, "You have eight colleges at Bowdoin." The menace of fraternities to the small college is the tendency to exalt the part at the expense of the whole, to transfer to the fraternity the allegiance which belongs to the college. Yet it is possible to exaggerate this tendency. Integrating influences are constantly operative. The diamond, the gridiron, and the gymnasium cannot be permanently dominated by cliques. Clubs innumerable draw undergraduates together in entire forgetfulness of fraternal bonds. Moreover, where the chapter houses offer accommoda-

tions to less than half the members, and where lower classmen for the most part are relegated to the dormitories, the dangers of divided allegiance are remote. Those who have observed the history of Greek letter fraternities in small colleges may regret many unhappy concomitants of the system; but were they asked to suggest a more effective organization of social life, they would postpone their decision.

ALLEN JOHNSON.

Bowdoin College, Brunswick, Me., October 23.

POWER OF THE YALE FACULTY.

TO THE EDITOR OF THE NATION:

SIR: In an article of mine in the October *Atlantic*, on "Externalism in American Universities," occurs the sentence:

Chiefly at Yale of all the leading universities is there some vestige of real power remaining to the faculty.

To those who have fuller personal acquaintance with the facts, the expression "some vestige of real power" has seemed entirely insufficient. And because of the importance of Yale's example, and to correct any wrong impression which my own statement may have given, I have asked the kind permission of Prof. E. P. Morris to quote from a letter which he has had the courteous interest to write me:

The printed constitution gives the professors in each department (Yale College, the Sheffield Scientific School, the Law School) the determination of the "permanent policy" of the department, subject to the concurrence of the President and to ratification by the Corporation. As interpreted by custom here, this means that the professors settle the course of study, fix standards and methods of instruction, adjust the relations between departments, and determine how much instruction is needed. In particular, we have by vote of the Corporation the right to nominate all officers of instruction, whether permanent or non-permanent, and in the case of appointments for a limited term we recommend the amount of the salary. We make out every year a budget of the expenses of instruction, we appoint and name our own committees, we make our own rules for the conduct of our business, and we elect our own dean.

In all these matters our action is subject to the concurrence of the President and the Corporation, but here custom supplements written law; the veto power of the President is very rarely used, and during the sixteen years that are within my personal knowledge the Corporation has not found it necessary to reject a nomination made by us.

This may not be an ideal constitution, but it seems to me to embody some sound principles. The Corporation, to whom the credit of shaping it belongs, has reserved to itself the management of the finances—the heaviest of the responsibilities—and the final decision in matters of importance, but has desired to divide the other responsibilities and to place them in the hands of those who can best meet them. Such a division of power is safe, I suppose, only where it is backed by a long tradition of independence and of friendly feeling; nothing prevents friction so well as a sense of common responsibility.

An authoritative statement of the extent of faculty power at Yale will certainly be appreciated by all to whom our academic constitutions are of interest, and who have been struck by the fact that the form of government in most of our colleges is so contrary to that of European universities generally, and in such contrast to the political forms which prevail with us.

GEORGE M. STRATTON.

The Johns Hopkins University, Baltimore, November 5.

Notes.

Next week Houghton, Mifflin & Co. will have the following books ready: "Greece and the Ægean Islands," by Philip S. Marden"; "Memoirs of Monsieur Claude, Chief of the Police under the Second Empire," translated by Katharine Prescott Wormeley; "Longfellow's Sonnets," edited by Ferris Greenslet; "Life of William Pitt Fessenden," by Francis Fessenden; "Federal Regulation of Railway Rates," by Albert N. Merritt; and the ninth volume of the Riverside edition of Thomas Bailey Aldrich's Works.

Albert H. Smyth's edition of Franklin has been added to Macmillan's Eversley Series, in ten convenient and low-priced volumes.

Owen Wister's next book, to be published by the Macmillan Co., is "The Seven Ages of Washington," a study of the character of the first President and an estimate of his influence on the institutions of the country.

Henry Holt & Co. are publishing, in conjunction with Sir Isaac Pitman & Sons of London, "Shirley Brooks, of Punch: His Life, Letters, and Diaries," by George Somes Layard. Brooks was an attractive character, and his memoirs ought to be unusually interesting.

The English copyright on "Alice in Wonderland" expires this month, and cheap editions of the book are expected to invade England as they have already invaded this country. But the Tenniel illustrations are still under copyright.

T. Fisher Unwin publishes this month the first issue of the *International: a Review of the World's Progress*, edited by Dr. Rodolphe Broda of Paris. Dr. Broda has enrolled a permanent staff of correspondents all over the world to the number of about 250, who will contribute notes on political, economic, scientific, artistic, literary, and religious events. The review is published simultaneously in English, German, and French.

From John Lane Co. we have three copiously illustrated additions to the Spanish Series: "Toledo: An Historical and Descriptive Account," "Seville," and "Granada and the Alhambra," all by Albert F. Calvert. The illustration's frankly the thing. In each case a condensed and dry historical sketch is supplemented by a dash of guide-book; but it is the massed plates at the end which give to the books their peculiar value. The reproductions embrace not only natural scenery, with architectural and historical monuments, but paintings and endless details of building and ornamentation. Everything, in fact, is given except color. That is a necessary but grievous lack in Toledo, for example, where black and white can only suggest the real effect. One finds an occasional mistranslation—"gate" for *puerta* is awkward in the extreme, for the Cathedral—and there is at least one wrong label on a picture. But on the whole, there is little but praise for the plan and execution of these well-printed volumes. The plates are small in size, but clear, and will serve whether as material for study or as precious memoranda for the returned traveller.

The Johns Hopkins dissertation "Dares and Dictys" (Baltimore: J. H. Furst Co.), by Nathaniel Edward Griffin, is part of a larger work planned by the author. It consists almost entirely of a study of the origin of the "Ephemeris Belli Trolani" which goes under the name of Dictys of Crete. The unpublished section will conclude the discussion of this subject, and will deal also with the origin of the "De Excidio Troiæ" of Dares. By a curious coincidence the careful and elaborate argument which Dr. Griffin has presented in order to prove (what many scholars had already maintained) that the Latin "Ephemeris" of Dictys is really a translation from a lost Greek work was rendered unnecessary almost as soon as it appeared, by the publication of a substantial fragment of the actual Greek original in Part II. of the Tebtunis Papyri edited by Grenfell, Hunt, and Goodspeed. This fragment was found written on the back of a series of revenue returns dated in the year 206 A. D., and in the opinion of the editors is itself of about that date. As they remark, this puts back the date of composition of the Greek original to the second or, more probably, to the first century of the Christian era, so that "the traditional reference to the reign of Nero is no longer to be laughed out of court." This same discovery gives also the fullest confirmation to the contention of Dr. Griffin and others that the Byzantine historian, Johannes Malalas, drew directly from the Greek and not from the Latin version. Although the publication of the fragment has done away with the necessity for argument on the main proposition, one may still read with profit Dr. Griffin's discussion of the work of Dictys—especially as that work appears to have undergone different redactions in the centuries following its composition. Perhaps with the aid of the Greek fragment Dr. Griffin may be able to throw some light on this subject. A comparison with the Latin "Ephemeris" will be of particular interest, inasmuch as it was this version that influenced the writers of the mediæval romances concerning the legend of Troy.

Under the pseudonym of "Le petit homme rouge" an English journalist who has long been in close touch with French politics and literature publishes "Court Life of the Second French Empire" (Charles Scribner's Sons). Without containing anything very novel, the book gives a temperate and readable account of the working of the Court of Napoleon III., especially on the financial side, and deals with most of the personalities that composed it. The author is scrupulously fair to the Emperor, his knowledge of Paris is intimate, and his narrative is on the whole accurate.

Maeterlinck's essay on the signs of reasoning in plants gave its name, "L'Intelligence des Fleurs," to the collection of essays that, in the English translation, is entitled "The Measure of the Hours." It is now published separately under the title, "The Intelligence of the Flowers" (Dodd, Mead & Co.). It is by far the most interesting of Maeterlinck's latest essays (which were reviewed in these columns June 13, 1907), and will be welcomed by many in its new dress. The translation is, as before, by A. T. de Mattos, and the

illustrations, a new feature, are from full-page photographs by A. L. Coburn. The margins are decorated by W. E. Fisher, and if one must have decorated margins, these with their subdued tone, are least likely to annoy the reader. The cover is pleasing, and the volume, as a whole is a good example of the decorated gift-book.

A new monthly, *Zeitschrift für Religionspsychologie*, with the significant sub-title *Grenzfragen der Theologie und Medizin*, is published by the house of C. Marhold in Halle, and edited by a physician, Dr. Johannes Bresler, and a minister, Pastor Gustav Vorbrodt. The purpose is evidently a physiologico-psychological explanation of religious phenomena.

In the recent work of Prof. Karl Beth of Vienna, entitled "Die Moderne und die Prinzipien der Theologie" (Berlin: Trowitzsch & Sohn), we have one of the latest and best expressions of a new school of conservative theological thought, which demands that the traditional dogma must come to some kind of understanding with modern thought and criticism even at a sacrifice. The movement itself was started perhaps two years ago by the work of Superintendent Th. Kaftan of Kiel, entitled "Die neue Theologie des alten Glaubens," in which this influential churchman demanded indeed adherence to the three fundamentals of the divinity of Christ, the Atonement, and the Trinity, but was willing to discard, among other things, the theory of verbal inspiration. Kaftan's scheme is largely along the lines of the best Ritschlian theology. Another pathfinder in this tendency is Prof. R. Seeberg, the conservative colleague of the more critical Harnack, in Berlin. In his new work on the Principles of Protestanism he cuts out from the traditional Protestant system matter that he regards as not based on the Scriptures, but as developed by a sort of "rationalistic orthodoxy." On the other hand, Prof. W. Bousset of Göttingen, in a long series of essays in the *Theologische Rundschau*, declares that the new movement is an unsatisfactory compromise, and Prof. Wilhelm Herrmann of Marburg agrees with him. Beth's work is not only a discussion of the new principles involved, but also a full historical analysis of the genesis and development of the new school. It costs 5.50 marks.

In the posthumous work of Prof. W. Wrede, entitled "Die Entstehung der Schriften des Neuen Testament" (Tübingen: Mohr), we have in the shape of three lectures, delivered originally in 1904, and entitled "Paulus und die paulinische Briefliteratur, Die Evangelien, und Die Übrigen Schriften," a popular and clear expression of the more advanced views of modern criticism with reference to the origin of the different New Testament books. Wrede was the author of the work on Paul in the Religionsgeschichtliche Volksbücher, in which he took a rather hostile attitude toward this Apostle, especially in relation to the teaching of Christ, and these views are now repeated. Since Harnack's late works on Luke and the Acts, some of Wrede's views on these subjects have been made more than doubtful, but as a summary of critical views on a central problem of theological thought, this booklet of 112 pages merits close, although discriminating, study.

The new edition of "Meyers Konversations-Lexikon" has reached its sixteenth volume extending from Plaketten to Rinteln. The quality of freshness, of which the publisher of every new encyclopædia is eager to boast, stands out here in such leading articles as "Polarforschung"; "Polen," which makes mention of the part played by the Polish deputies in the first Russian Duma; and "Preussen," the history of which is brought down to July, 1906. The volume contains an excellent map of the globe representing the distribution of religions and Western missionary activity. Every mission station in Africa, China, and India is indicated, with its proper denomination, or separate sketch maps; an extremely useful feature in view of the frequency with which the missionary question appears in the present affairs of China and the Congo.

We have also received the first volume of "Meyers Kleines Konversations-Lexikon," extending from A to Cambric. The scope of this work has been entirely changed by an increase in the number of volumes from three to six, a step taken by the publishers, according to their own statement, in order to place before the public a work that should be at the same time comprehensive and low-priced. The 1,038 pages of the first volume correspond to some 2,500 pages in the large Lexikon, so that the new six-volume edition will be a little less than half the size of the parent work, and will correspond rather to one of our own smaller encyclopædias than remain a mere condensation. Comparing the articles in the first volume with the same titles in the *Grosses Meyer*, we find that the scale of one-half is not always maintained. Thus "Amerikanische Altertümer," which receives seven columns in the twenty-volume edition, has only one column in the present volume; "Afrika" is reduced from 25 pages to 8; "Asien" from 22 pages to 5; "Bier" from 15 columns to 4; and "Bildhauerei" from 20 columns to one Colored plates are much more sparingly used. Nevertheless, the smaller work, which sells at one-third the price of the large editions, seems to be prepared with the same scholarly care and to be well adapted for its purpose.

Under the title of "Die Mandschurei, Bilder aus dem russisch-japanesischen Kriege," the house of Karl W. Hiersemann of Leipzig has published an exceedingly interesting album of 389 war pictures on 122 large sheets. The album itself, prepared in St. Petersburg, contains the work of noteworthy Russian artists, done in aquarelle and in pen drawing, together with some photographs of officers on the field.

The fiftieth birthday of Hermann Sudermann, September 30, was marked by the appearance of the one hundredth edition of his novel entitled "Frau Sorge," which was first published in 1887. The house of J. G. Cotta has brought out the edition in exceptionally fine form, together with as excellent picture of the author.

Jules Renard, who has been elected to the seat of the late J. K. Huysmans in the Goncourt Academy of Ten, fitly represents the ideas of the founders. He is so independent that he made no canvass; he does not even live in Paris, but in the jealous retirement of a provincial hamlet. He is forty-three years old, and studied at the École Normale before it had lost its splendid literary character. He did not finish, but was obliged to go into commerce until literature could support him. At twenty-two he began with verses—"Les Roses"—but shortly found his way in sharp, clear, pointed stories etched from keenly sympathetic observation of everyday lives. His great success came with "Poil de Carotte"—the thoughts and feelings and unhappiness of an overlooked boy, child of a careless mother who is too indulgent to the others, her favorites. Jules Renard is remarkable for his simple, direct, and personal expression, without waste of words. He has had a certain success in short pieces at the theatre. Prof. W. G. C. Byvanck's book "Un Hollandais à Paris en 1891" set him down as the representative of "the generation of to-day." Another generation has arisen since then, but he remains a noteworthy figure of that activity in pure letters which has for its organ the *Mercure de France*, founded by him and his coevals.

The Rev. Reuen Thomas, pastor of the Harvard Congregational Church in Brookline, well known in Congregational circles in England and America, died in Brookline November 9. Born in Warwickshire, England, in 1840, he attended the Collegiate School of Sutton-Caldfield and University College, London, and entered the Congregational ministry in 1862 as assistant to the Rev. Newman Hall, of Christ Church, London. Later he continued his studies at the University of Rostock, Germany, and received the degree of doctor of philosophy in 1865. After holding pastorates in Liverpool and London, he accepted a call from the Harvard Church, of Brookline, in 1875. Dr. Thomas was the author of several books, including "Divine Sovereignty," 1885; "Through Death to Life," 1888; "Leaders of Thought in the Christian Church," 1892; "Kinship of Souls," 1899; and "Grafenburg People"; and he was a frequent contributor to reviews and religious periodicals on both sides of the Atlantic.

The death is announced from London of Gerald Massey, in his eightieth year. His poems, first published in 1889, under the title of "My Lyrical Life," have been several times reissued. Other books of his are "Voices of Freedom and Lyrics of Love," 1851; "The Ballad of Babe Christabel," 1854; "Craigcrook Castle," 1855; "Shakespeare's Sonnets Never Before Interpreted," 1866; "Concerning Spiritualism," 1871; "The Natural Genesis." 1883.

AMERICAN COLONIAL HISTORY.

The American Colonies in the Seventeenth Century. By Herbert L. Osgood. Vol. III. Imperial Control: Beginnings of the System of Royal Provinces. New York: The Macmillan Company. $3 net.

In accordance with his plan announced several years ago, Professor Osgood has completed his study of the colonies in the seventeenth century by the issue of the third volume, dealing with imperial control. As far as method, style, and temperament are concerned, the present volume in no way differs from those that have gone before. There is the same impersonal objective mode of approach, the same rigidly scientific in-

terpretation of facts, the same interest in the legal and institutional aspects of the subject, and the same disregard of all that is dramatic and picturesque. We read little of religion, education, and literature, and nothing of housing, domestic economy, food, the turf, architecture, fashion, or social relations. It is true that the colonists in the seventeenth century were little concerned with some of these things, but had they been concerned, Professor Osgood would have displayed little interest in making such topics a part of his treatment. His business is to present the colonies as institutions whose place and history are capable of exact legal definition, whose internal and external development deserves analysis from the point of view of government, administration, and law, and whose place in the scheme of world history can he logically determined. The first two volumes were devoted to the colonies considered as separate entities, under corporate or proprietary management, without regard to their connection with the higher authority in England; the third is designed to present them as parts of a growing imperial system, the head and the centre of which were in London, and the circumference of which embraced the far-lying settlements that formed the crude material out of which the empire, apart from the kingdom, was gradually taking shape.

The steps in this process, as far as they concerned the original thirteen colonies in the seventeenth century, form the chief interest of Professor Osgood's book. Though presenting much that is new and hitherto unknown, it rehearses, in the main, facts that are more or less familiar. But the story of the colonies has a new look, the old friend has a new face, the landscape is seen in a new perspective, the proportions are adapted to a new scale; certain phases of the subject that formerly played little part in colonial history here occupy a large space on the canvas, while others that used to he, and still are, stock in trade to many a writer, have either disappeared altogether or been relegated to a very unimportant place. And these changes in the size and proportion of things have all taken place because Professor Osgood has chosen to believe that the home government was a factor which played a very influential part in colonial history, and that its policy, system of control, and actual management of colonial affairs form a subject so essential to an understanding of colonial history that its omission from nearly all the earlier treatises upon the colonies will always remain something of a mystery. For a number of years a few scholars have cried out against this neglect; but now that Professor Osgood's book is before the public a wider circle of students will appreciate the significance of the omission. Professor Osgood states his purpose and sums up the situation in the following words:

> In the present volume attention will be called to the influence which was exerted over the colonies and over the proprietors who coöperated in founding them by the British government, that is, by the sovereign power under whose protection they all came into existence. Under this aspect of the subject the emphasis will be laid on British and general imperial interests, which operated as a restraint upon the tendencies in the colonies toward local independence. . . . Historians have hitherto neglected this side of the subject or have treated it as foreign or inimical to the colonies. . . . To the colonists such authority was certainly not foreign; . . . It was a part and a condition of their existence. When properly exercised this authority did not involve a meddlesome interference, but was as necessary and inevitable as were the tendencies toward isolation and independence in the colonies themselves.

After an opening chapter on the nature and organs of imperial control, Professor Osgood passes to the first concrete illustrations of British policy, the dissolution of the Virginia Company and the relations with Massachusetts prior to the great Civil War. He continues the history of Virginia as the first royal colony from 1624 to 1640, and then, turning to the home government, traces the variations in its colonial policy and management during the Civil War, the Interregnum, and the Restoration until 1675, narrating at length the experiences of the Royal Commission of 1664. At this point he resumes his outline of events in Virginia, analyzes the causes and results of Bacon's rebellion, the career of the Royal Commission of 1677, and carries the history of Virginia to the close of Effingham's administration in 1689. Then turning to New England, he deals with the difficult question of England's later relations with Massachusetts and the dissolution of the company, with royal government in New Hampshire and New York, and with the establishment of the Dominion of New England. His final chapters concern the Revolution and its after results in New England, New York, and Maryland, and finish with a brief summary of conclusions, covering the leading aspects of his work.

From this brief statement and from a further perusal of the work, two conspicuous limitations appear: First, Professor Osgood has confined his attention to the territory of the United States and to the relations of the British Government with the original thirteen colonies. He says:

> This book contains less than a history of British colonial administration because the island colonies, with Newfoundland and Nova Scotia, are for the most part left out of account. . . . If one were treating of colonial administration alone, without particular reference also to institutions of the United States, he would take his stand in England and trace the development of the system wherever it appeared along the entire American coast. The plan of these volumes is somewhat more restricted than this, and limits our attention chiefly to the middle section of the great arc [from Newfoundland to Trinidad]. But the existence of the colonies which did not become parts of the United States must not be forgotten. . . . Administrative control by the British government over the island colonies became at an early date continuous and vigorous. After the Restoration the system of royal government was rapidly extended over these colonies; royal appointees of all sorts were sent among them, . . . elaborate sets of instructions were given to the governors. . . . Precedents which were favorable to active imperial administration were first established on a large scale in the government of the island colonies. The system was most thoroughly tested there.

In the second place, Professor Osgood has further restricted his field by ignoring to a very considerable extent all questions of trade and commerce, illicit trading and smuggling, money and exchange, trade-routes and markets, and problems of British revenue. Had he not done so, he would have been compelled to take cognizance of the island and other colonies that he expressly places outside the sphere of his interest. He is not writing a history of British colonial administration. Perhaps for this reason he is able to throw but little light upon the actual operation of the British system in America, and contents himself with recounting certain exceptional incidents that came to the attention of the home authorities, connected with the names of Randolph, Rousby, Bland, and Miller. Of the system itself, estahlished after 1672, he tells us practically nothing. It is probable that in the end, even after all the data are collected, there will be hut little to tell, as information on that point is scanty; hut Professor Osgood might have laid a little more stress upon the machinery set up to collect the "plantation duty" under the Act of 1672, even though many of its early features will always remain more or less obscure.

In three particulars does Professor Osgood differ in his manner of approaching his subject from the writers who have preceded him. The first point of difference is that he views the colonies, particularly the royal colonies, as British dependencies subject to a higher sovereign authority in London; secondly, he treats as essential and organic parts of his subject such topics as the growth of British colonial policy, British organs of administration, the acts of trade, and the royal commissions—some of which will appear as novelties to many readers of colonial history—and he sets them in the very forefront of his narrative; thirdly, he maintains with noteworthy consistency the point of view once taken, and never loses sight of his main purpose—to bring together for continuous treatment all aspects of British and American history which concern the problem of colonial control and administration. In accomplishing his object he has made an exhaustive use of the Calendars of State Papers, Colonial, and has analyzed their contents with painstaking skill and understanding. Probably no previous writer has used these collections of invaluable material with the thoroughness that is here exhibited, and probably not a few of those already familiar with colonial history will be surprised to learn how much those volumes actually contain. Professor Osgood shows little familiarity with the original papers, but except in matters of detail it may be doubted whether a perusal of the complete documents would have altered essentially his conclusions.

The portions of this volume containing the most valuable contrihutions to our knowledge of colonial history are those relating to the British system. Not only is the presentation thoroughly original and sound, but it is also illuminating and creative. No discussion of the navigation acts has dealt so clearly with the commercial principle of the staple—that mercantilist device whereby all colonial exports and many colonial imports were forced to pass through the ports of England. And no one, so far as we know, has ever pointed out the influence of Virginia and the tobacco trade in giving shape to the doctrine of the enumerated commodities. Though a competent history of the navigation acts has yet to be written, Professor Osgood has not only made a very suggestive and enlightening contribution to the subject, but has also pointed out the direction that his successors must inevitably follow.

This work marks an epoch in the writing of colonial history. Hereafter no writer, teacher, or student can ignore the plain lesson which it sets forth or allow himself to perpetuate the shallow particularistic conception of thirteen colonies practically independent of British control that has hitherto held sway. When the eighteenth century comes to be treated in like manner, the truth of Professor Osgood's contention will appear in a form still more emphatic; British control will assume a more orderly and unified form, and Burke's famous remark about "salutary neglect" will need as much modification as does the great orator's later comment upon the Board of Trade and the uselessness of its records. A larger colonial world is beginning to take form in the minds of modern scholars, much as three centuries ago it began to take form in the minds of English statesmen and mercantilists—a world, the centre of which was at Whitehall, where the Privy Council, the principal Secretaries of State, the Admiralty, Treasury, and other departmental boards had their seat, and where the Board of Trade sat in the "Cockpit" as the advisory and inquisitory agent of the crown, while the outlying members were the colonies from Nova Scotia to Barbadoes, nearly thirty in number, under a common administration, subject to common trade laws, customs system, and admiralty control, and guarded with a jealous and watchful eye. They were fostered because they contributed to the wealth of the kingdom, and protected because they furnished available strategic points in England's many struggles with the great maritime rivals of the Continent. The history of this larger world must be written before our thirteen colonies take their proper place in the progress of civilization. We are beginning to discover how substantial was the British system and how well ordained were the organs established for the execution of its purpose. When in the past the system has been discussed at all, the temptation has been to lay stress upon its weaknesses and its defects; the business of the future will be to show how much it actually accomplished. In the eighteenth century all the colonies but four were royal colonies, Governors' instructions were made more mandatory and inclusive, royal appointees spread like a network over the colonies, agents from every colony resided in England, and the system of supervision in matters that concerned the Plantations General reached a high point of completeness. When all the evidence is gathered and massed together, the system of British control will assume unexpected proportions, and will be found to be inextricably interwoven with the life and government of the colonists. Even in the seventeenth century we begin to feel that the revolutionary struggle to come was not between a people and a King, but between a people and a system—a far better ordered system than most of us have been inclined to believe. If this be true, the time will come when the causes of that revolution will undergo revision in the light, not only of new evidence, but also of a new and more thorough understanding of the problems involved. Perhaps Professor Osgood himself will undertake the larger task; if not, he may well be content with playing the part of a pioneer in thus opening up a phase of history little explored, and never systematically investigated.

CURRENT FICTION.

The Folk Afield. By Eden Phillpotts. New York: G. P. Putnam's Sons.

This book is, to say the truth, a little disappointing to a reader who has fresh in mind the remarkable novel called "The Whirlwind," published but a few months ago. Here is a miscellany of short stories, in various moods and keys, but of no marked power. It seems to be the fate of English short-story writers just now to cultivate versatility at all costs. Of recent months one recalls, for example, volumes by Quiller-Couch, Maarten Maartens, and Vincent O'Sullivan. In every instance there is an air of continual experiment. Shall we write amusingly, or profoundly? Shall our next be a bit of genre, or a psychological studylet, or a yarn, or a *conte*? It is all the same to us, for it is our aim to have the whole business of fiction at our finger-tips. Will you take a bit of George Eliot, or Hardy, or Kipling, say, or Maupassant? It cannot be denied that this book by Mr. Phillpotts leaves a similar impression of tentativeness, of, let us not say insincerity, but insecurity. The "Foreword," to be sure, claims little for the tales. "These stories," it reads, "pretend to be no more than swift and slight impressions of those humble people who alone at any time or place concern my work." In a sense they are, he further intimates, notes on travel which, from inveterate habit, he is led to cast in the form of fiction. Italy, Algiers, Egypt, the West Indies, France, Syria, the high seas—so varied is the setting of his narratives. They are fairly good stories, and not more than that—for a Phillpotts. One of them, "Pierrotin from Paris," is worth all the rest—extremely good, even for a Phillpotts. But it is not sufficient to persuade us that the short-story form is that from which this writer should expect the best result, or to which he should devote much energy. One novel like "The Whirlwind" is worth (if not, alas, in a commercial sense) a thousand tidbits such as he here lets fall from his table.

Money Magic. By Hamlin Garland. New York: Harper & Brothers.

Mr. Garland has covered much ground since we welcomed "Main Travelled Roads," as a promise of the crude sincerity to be hoped for in the New Western fiction. Unfortunately, however, his subsequent development has been entirely towards conventionality, without a corresponding gain in finish of manner or thought.

Bertha Gilman, Colorado "biscuit-shooter," consents to marry an elderly gambler on condition of his closing the gaming houses and living upon some mines which turn out a fabulous fortune yearly. This man, Haney, meets with a grave injury in the usual brawl, and there is a hasty marriage so that the young woman may inherit. Haney, however, recovers and (except on one occasion) proves himself a model American husband, with no wish in life but that his wife shall spend money on amusement and personal ornament Naturally the girl-wife (in spite of her experience as waitress in a restaurant) is in that condition so prevalent among young ladies in fiction, a condition popularly known as "unawakened." Equally as a matter of course, her awakening comes about through the agency of a handsome young man. Her husband considerately plans suicide, but even this crumpled rose leaf is removed from under her. While climbing a high hill, to carry out his intention, he dies of heart failure; his potion of strychnine was not needed so that for Bertha and for the world in general "self-murder was never written opposite the name of Marshall Haney."

An interesting point might have been made of the way in which Bertha immediately learns all about clothes, to a point that satisfies Chicago society, both fashionable and artistic, while her diction to the last remains that of the free, untrammelled quick lunch counter.

The Romance of an Old-Fashioned Gentleman. By F. Hopkinson Smith. New York: Charles Scribner's Sons.

Adam Gregg, artist, is summoned to Maryland to paint old Judge Colton's young peach-blossom wife. Improvising a studio in the attic, Gregg poses the lady against a background of flowers, and the picture ends by realizing his highest hopes. Judge Colton has been away for a month and the finished portrait is to surprise him on his return. Unfortunately, the low-necked dress scandalizes the old gentleman, and he makes some nasty remarks. Even the fact that his own mother had actually worn the offending garment does not appease him. Adam and Olivia have one sad talk together, and Adam rides honorably away. After that, metropolitan successes crowd upon him. Honorably, he refrains from making any inquiries about the Coltons. Hearing by accident of the judge's death (many years after), he hurries to Maryland, only to find a burned house and a vague rumor of Mrs. Colton's being "daid." The picture, however, masquerading as a Gilbert Stuart, turns up in New York, and through it he establishes intimacy with Philip Colton (Olivia's son), now a rising young business man. Philip has become so acclimated in New York that he is making a fortune by holding his tongue as to the real amount of copper in a certain mine. Shamed by the sight of his mother's face, and by Gregg's denunciations, he tells the truth, fails disastrously, and is severed from his betrothed. Within a few days he is made head of a bond department at a salary of $10,000 a year, and marries his Madeleine. Before long a little blue-eyed, golden-haired Olivia is old enough to be lifted up and to place flowers before Olivia's picture, which never leaves its place over the mantel in Gregg's studio.

This story is almost sure to please those who enjoyed "The Lonely Lady of Grosvenor Square."

A Fountain Sealed. By Anne Douglas Sedgwick. New York: The Century Co.

The novel of adventure is not necessarily one of physical movement. There are books where the adventure is intricate and incessant, yet chiefly concerned with the emotions; with the shadowy doings of introspection, criticism, self-consciousness, thought-transference; where looks do battle, attitudes announce discoveries, and eyes talk metaphysics. The plain citizen, the clamorer for a simple story, will not take kindly to "A Fountain Sealed." On the other hand, the reader who is attracted by the

subtle in style and substance, who likes a maximum of soul-searching with a minimum of "scene," will find it a mine of interest, and will have the further satisfaction of perceiving that a novel may deal with the subtleties, yet be unquestionably clean. There is a story, and an absorbing one, but it relates chiefly to states of mind. The opposing forces are led by the lofty, spiritually-assured Imogen and by the buoyant charmer, the comfort-bringing Valerie. The chronicle is of them and their respective adherents, their encounters, their contentions, their exchange of prisoners and partisans, and their final retirement into their appointed destinies—nominal victory for one camp, for the other nominal defeat.

Side by side with the ultra refinement of treatment, with the abstinences, discretions, and withdrawals, there lies in parts of the character-drawing a perilous likeness to caricature. More especially is this true of Imogen, whose self-righteousness reduces her at times to the absurd; and of the Pottses, man and wife, who sit Chadbandishly in the surrounding preciosity. It seems open to question whether an uncomplex, inarticulate Englishman would become interested in having the over-soul expounded to him by even the most beautiful of Americans, but that is only a detail in a whole which concerns itself with the events of the emotions. One of the most admirably drawn characters is the ghost of Mr. Upton, who has just died when the book opens. His pompous mediocrity, indeed, is the pivot of the entire action. An idolized memory, he sits above exaggeration. A bore, fathomed but buried, he passes beyond the chances of unreal detail into the region of entire credibility. If affairs are unlikely, they are at least vivid. If the characters are not always real persons, they are amazingly real pictures. Imogen is in the main consistent if improbable, and perhaps, after all, she is no more grotesque than an absolute egoist always must be. The summarized Valerie of the ante-novel period is not quite easy to reconcile with the tactful Valerie of our history; with the Valerie whose detractor accuses her of "a smile that claimed nothing yet that chained men"; of "a vague, sweet silence, that judged nothing, yet softly blighted, through its own indifference, all other people's enthusiasms." The pages themselves must be read to show how the little touches pile themselves up into a substantial structure of import and dignity.

Sundry carelessnesses speckle a generally elaborate manner. Mary is Mary Colton in the first chapter, but Mary Osborne in the eighth, though neither married nor changed at birth. In one place the word "competent" seems to have taken possession of the pen, and we have on one page, "competent reticence," "feverish competence," a "cool and competent" lover. Imogen, Botticelli Madonna-like in person, has long, narrow hands with square finger-tips, at one time; at another her lover gazes admiringly on her hand with its pointed, up-turned finger-tips.

Laid up in Lavender. By Stanley J. Weyman. New York: Longmans, Green & Co.

If the twelve stories in this volume are only newly taken down from a fragrant shelf, as the title suggests, and as internal evidence hints, they are none the less fresh and neatly pointed. Each one has its pivot of clever invention and its deft wording. Some of them familiarly suggest the famous teller of tales of intricate adventure; others turn for interest on the mysteries inherent in old English abodes; others yet are of humorous episodes with amusing and kindly portraits of the English types that Trollope and *Punch* have brought home to the American heart, but in situations that it has been left to a Weyman to devise. Each has its motive and its surprise, prepared with nicety and approached with a craftsman's pen. The variety of provender supplied in the group makes a wholesome and digestible banquet from nourishing soup, through seasoned entrée to contenting coffee.

Letters from The Raven. With Introduction and Critical Comment by the Editor, Milton Bronner. New York: Brentano's. $1.50.

One's first thought is that these letters of Lafcadio Hearn ought to have been included in the general collection published by Mrs. Bisland last year, yet perhaps there is an advantage in having them by themselves in this little book. Their flavor gains a certain pungency by this isolation from his general correspondence.

When Hearn came to Cincinnati at the age of nineteen he was introduced to a printer named Henry Watkin, an Englishman of little formal education but of some taste for the exotic in literature, and the two exiles became intimate. Mr. Watkin was soon the "Old Man" or "Dad," while the boy, "by virtue of his dark hair and coloring, the gloomy cast of his thoughts, and his deep love for Poe," became "The Raven." Hearn had a trick of dropping in at the printing shop at any hour of the day or night, and of leaving cryptic notes for the "Old Man," signed with the picture of a saucy or dejected raven as the case might be. "These chambers are cursed with the Curse of Silence. And the night which is the Shadow of God, waneth," wrote the young disciple of Poe on one of these occasions. There is a good deal of interest in these notes and in the letters which later Hearn wrote to Mr. Watkin from Memphis and New Orleans. They show his early *Wanderlust:* "My heart," he says, "always feels like a bird, fluttering impatiently for the migrating season." They are filled with bits of weird description such as this of his lodging while delayed at Memphis on his way to New Orleans:

> My room is carpetless and much larger than your office. Old blocked-up stairways come up here and there through the floor or down through the ceiling; and they suddenly disappear. There is a great red daub on one wall, as though made by a bloody hand when somebody was staggering down the stairway. There are only a few panes of glass in the windows. I am the first tenant of the room for fifteen years. Spiders are busy spinning their dusty tapestries in every corner, and between the banisters of the old stairways. The planks of the floor are sprung, and when I walk along the room at night it sounds as though Something or Somebody was following me in the dark.

From New Orleans we get vignettes of his strange Creole life, as we already know it, and new hints of odd occupations, such as the attempt to conduct a five-cent restaurant. The correspondence lags toward the end, with only four notes in all from Japan. These, however, have a certain importance, in so far as they confirm the impression that Hearn, before his death, was growing impatient of Japanese life, and still felt the throbbing *Wanderlust.*

Even more remarkable than the Watkin letters is a group of notes written in Cincinnati to an *inconnue.* Hearn, at this time in his twenty-sixth year, was a reporter on Murat Halstead's *Commercial;* the lady, whose name is not revealed, was apparently of some social position. Evidently she became fascinated by the exotic young writer and sought his confidence, if not a rather highly-colored platonic friendship. Her letters are lost, but Hearn's, which she returned to the writer, were given by him to Mr. Watkin, with the command to do with them as he thought best. They do not lend themselves easily to quotation, but they give glimpses into a curious relationship. "You have acted throughout, or nearly so, upon sudden impulse, which was injudicious," he writes after some misunderstanding; "and when you found me acting in the opposite extreme, the necessary lack of sympathy in our actions prompted you to believe that I was 'heartless.'" At another time he is saying: "I feel generally very reluctant to unbosom myself on paper, not knowing who might behold the exposition, and sneer at it, without being capable of understanding it." There is a tantalizing restraint in all that he writes to her, which would, perhaps, be better understood if we possessed the other half of the correspondence.

Deutsch in Amerika. Von Prof. Karl Knortz. New York: G. E. Stechert & Co.

Some readers may throw Professor Knortz's book aside in disgust on turning the introductory pages (which are clearly intended for a public in Germany) and before discovering that much of the work is timely and meritorious. That the title is ambiguous is not the only stumbling block; the purpose of the Introduction seems to be to stir up the smouldering embers of misunderstanding by pretending that all Americans distrust Germans, to collect all the fire-flies of dislike that together they may appear a dangerous flame. The Pennsylvanians of Penn's time and their anxiety lest Pennsylvania should become a German colony are cited as an old example of American antipathy, and we are charged with being envious and concerned with keeping Germans altogether out of the country. Dewey's victory is belittled, not so much for the purpose of presenting it in its true historical light, as for fanning anew the breeze about the Germans at Manila. John Hay is branded *ein echter Jingo* and *Anglomane.* The spirit of such writing is mischievous in the extreme, and intellectually and morally not a whit above page after page of bitter and unjust invective against America such as one may find in German journals for the last half century. That which makes the act more reprehensible is the status of Karl Knortz as a resident of America and student of American affairs, the translator of Longfellow and compiler of German and American literature.

Yet, as already stated, the book has much to commend it. Professor Knortz is con-

vinced that Deutschtum in America is on the wane, and devotes his energies to discovering, if possible, the causes of the retrogression. Numbers of Germans in America never had the best of schooling while in Germany, or else were drilled in a study of Old Testament worthies, rather than of German poets, musicians, and artists; and finding that they had no need of these higher things to "make money" here, have settled down to German-American materialism. These men are never moved by spells of homesickness for the Fatherland, and the old-time emigrant sung by Freiligrath is a thing of the past. The thrifty German soon becomes a "four-story-house-owner," notes that the local newspaper prints items about his health and that of his family as the home paper in Germany used to do about the all-mighty prince; and, like Lenau, he soon loses his love for the country of his birth.

Not the least interesting of the themes discussed by Professor Knortz is the use of the German language in America, its chance of survival, and, incidentally, the acquirement of English by the immigrant, or rather his failure to acquire it, and the reason why. Knortz attributes much of the German's shyness to the disposition of American children and elders to laugh at "broken English," and he intimates that this is particularly an American vice; yet any one who has lived or travelled widely abroad will know that all peoples are prone to titter or roar at the slips of a foreigner in speech. When Professor Knortz, however, says that the average American boy or girl underestimates the difficulty of mastering a foreign tongue, delays beginning, tackles it superficially and usually throws it aside in disgust, he is right: we are still a nation of dilettantes in the acquisition of tongues, and undoubtedly prone to withhold from others due credit for mastering our own speech. Professor Knortz is also right when he reviews the withdrawal of German from the majority of grammar schools outside of Ohio, Wisconsin, and Indiana—forgetting, however, the good work in German in the Baltimore schools. He is right, too, in criticising severely the policy of sending out to grammar and high schools teachers so little prepared to instruct in German that they know nothing, or almost nothing, of German life and literature. But when Professor Knortz demands that such teachers should be able to speak *ein fehlerfreies Deutsch* he goes too far—not, of course, in respect to the ideal, but in consideration of what one actually meets with the world over. *Das Sprechen ist etwas an und für sich:* every student of long residence in Germany can count upon the fingers of one hand the *berühmte Gelehrter* in the field of English who can talk our mother tongue like a native. The average *Doktor phil.* who has become *Lehrer* in a *Gymnasium* or *Realschule* and is stocked with Beowulf and Chaucer, bombards you with a *schauderhaftes* English; and one has only to run through contributions by German teachers of *Englisch* to their half century of *Programms* to find the most astounding errors as to content and idiom—errors that might easily have been avoided if the writer had submitted his manuscript before publication to some resident American or Englishman. Archaic Latinized words experience renaissance, and William Gilmore Simms is given a chapter as lengthy as that accorded to Longfellow or Emerson. Professor Knortz praises the steadily-growing facilities for the study of German in the higher institutions of America, and thinks that it is easily driving Latin and French from the field.

German Vereins in America also come in for a review and a dressing down at the hands of the German-American professor. Some are all very well, but the most awful are the so-called *literarische Vereine*, such as that at Belleville, Mo., which recently gave, instead of sweetmeats from Jean Paul or plums from Goethe—"*eine grosse* euchre party." One thing is evident, and as commendable as it is unique and interesting, and that is that Professor Knortz deprecates the excessive drinking of beer at the gathering of his tribesmen. In conclusion, Professor Knortz cites as evidence of the retrogression of the Germans in America the facts that German-American newspapers are disappearing, German-Americans journals and books are published less and less, German bookstores are failing here, and German theatres closing up. He says that beyond doubt the growth of the German language in America depends on the immigration of Germans, who, however, are coming in fewer numbers to our shores. To counteract this falling off in interest and loyalty to German things, Knortz advises the further establishment of German kindergartens, the erection of monuments to distinguished Germans in our public parks, the presentation to schoolchildren of easily understood German heroic and historical plays, the giving of free lectures on the history of the Germans in America, active participation in politics without blind party allegiance, the yearly distribution of instructive books to those learning German in the upper classes of public schools, the dissemination of German literature, and the support of the German press and theatre. He would have also genuine accomplishment in professional life, showing the Yankee at all times what a German can really do.

Lectures on Humanism: With Special Reference to its Bearings on Sociology. By J. S. Mackenzie. New York: The Macmillan Co. $1.25 net.

The title of these nine lectures delivered at Oxford will probably mislead the reader of contemporary philosophy. Professor Mackenzie does not use the term humanism as the equivalent of pragmatism, and the subject of his book differs widely from that discussed by Prof. F. C. S. Schiller, for example, in his two volumes which bear similar titles. It is humanism in the older and correcter sense that is here considered:

> What I understand by humanism may be most simply described as a point of view from which human life is regarded as an independent centre of interest, if not even as containing within itself the key to all other interests, or as being, in old Greek phraseology, the "helm" by which the universe is steered.

The theory is the opposite not of intellectualism, but of naturalism in the realm of science, and of supernaturalism in the realm of religion. The author sets forth his opinions with constant reference to the history of philosophy. He finds that the naturalism of the early Greek philosophy gave place to the humanism of the Sophists and of Socrates. He traces the rise of humanism during the Renaissance, but holds that it found no adequate expression until the time of Kant and Hegel, regarding the system of the latter as "an almost complete humanism," but overestimating the naturalistic element in the Critical Philosophy. He says that Kant's doctrine that things in themselves are unknown "fatally limited" his humanism; whereas we should say that Kant by this doctrine virtually abandoned a naturalistic position, and made his system necessarily humanistic; for the "things-in-themselves" are for him nothing but the negative limits of knowledge. Indeed it seems more reasonable to regard Hegel's "humanism" as "fatally limited" by his theory of an Absolute developed as Nature.

Throughout these lectures the opposition is emphasized between the quantitative, mechanical view of nature which is prevalent in modern science, and the qualitative and teleological view which Professor Mackenzie regards as the true philosophy. The man engaged in the investigation of nature may possibly leave out of view qualitative differences in his ultimate conceptions of the universe; but the philosopher approaching truth by the inner path must necessarily assert the reality of purpose and will in the constitution of the world of which he is a part. The philosophical position is therefore ethical rather than mechanical.

> When we say that we set ourselves to achieve an end or carry out a purpose, what happens is: (1) that something presents itself to us as a good; (2) that we "identify ourselves" with this end, *i. e.*, that it fits into the general system of our conception of good on the whole; (3) that, as a result of this, certain organic adjustments begin to take place. These organic adjustments, so far as they are simply physical facts, take place in accordance with the general laws of material phenomena, *i. e.*, there is transference of motion, but no real creation or loss. The end or purpose—the recognition of something as for us a good—would seem here to be the real explanation of the change that takes place; and it may be doubted whether we have any real reason in the end to look for any other kind of explanation.

While in the earlier part of the book the discussions are somewhat abstract and sometimes obscure, even those not metaphysically trained can read with perfect understanding, lectures iv-ix., which deal with the applications of these teleological principles to politics, economics, education, and religion. The author everywhere illustrates his principles so that there is no obscurity in his teaching. Here, for example, is an interesting exposition of humanism in relation to politics. After showing that the old Greek city-state seemed to have a far more humanistic character than our modern political types do, he adds:

> Perhaps the most hopeful case for such a purpose in our modern world would be such a nationality as Japan, with its intense unity and enthusiastic aims, based on what may be described as a social and political religion. If we are to treat European nationalities in a similar fashion, it would almost be necessary to regard them as a single unity for this purpose. And indeed it is almost natural for the modern sociologist to regard the whole world. . . as the unity within which the developing life of man is to be regarded as becoming realized.

In the lecture on Humanism in Education, there is a discussion of the relative value of scientific and humanistic studies which is of some pedagogic interest, although it is original and ingenious rather than convincing. He concludes that even from a utilitarian point of view, the humanities are as valuable as the natural sciences. In a book of less than two hundred and fifty pages, it is of course impossible to treat adequately the great problems which Professor Mackenzie has raised; but he has at least succeeded in talking in an agreeable and interesting way about them. The inadequacy is most apparent in the lecture on Humanism in Religion, where the condensation of statement tends to obscure the author's distinction between humanism and supernaturalism.

The Virgin Birth of Christ. By James Orr. New York: Charles Scribner's Sons. $1.50 net.

The Birth and Infancy of Jesus Christ, According to the Gospel Narratives. By the Rev. Louis Matthews Sweet; with an Introduction by James Stevenson Riggs. Philadelphia: The Westminster Press. $1.50 net.

The Incarnation and Recent Criticism. By the Rev. R. J. Cooke. New York: Eaton & Mains. $1.50 net.

In his recent "Problem of the Old Testament" Professor Orr of the United Free Church College, Glasgow, presented the ablest defence of the conservative position in Old Testament criticism that has appeared in many years, and his present volume on the Virgin Birth is likewise as skilful and valiant an apology for the traditional view on that subject as is likely to be written. Dr. Orr is a past master in argument. He keeps the main point at all times clearly in mind, marshals his facts in effective order, is shrewd in the discernment of an opponent's weak points, understands how to make his adversaries appear to refute each other, and, above all, lends to the weight of his reasoning the force of sincere and positive religious conviction. The present volume adds nothing new on the subject, or at least nothing of great importance, but as a popular presentation of the arguments on the conservative side it will not easily be surpassed.

His attitude, however, is that of a doughty defender of the faith, a polemic theologian, not of an historical critic or a seeker after light. He sees that an important doctrine of the faith is "assailed," and speaks constantly of "hostile critics," who are "attacking" the citadel of faith. He springs courageously to the rescue, and is resolved to maintain the fortress at all costs. Such an attitude scarcely admits of full justice to the critical difficulties in the way of acceptance of the Virgin Birth, and in fact neither the discrepancies in the narratives, the silence of large portions of the New Testament, nor the views of Christ's dignity, which apparently had a different basis, appear in Dr. Orr's pages in their full force. He cannot perceive the slightest legendary tinge in the early chapters of Matthew and Luke, or the smallest inconsistency in the genealogy of Jesus being traced through Joseph. He rejoices in the discrepancies between the two accounts of the birth, and speaks of their "deep and beautiful harmony." He is totally unmindful of the capacity of Biblical writers for accepting diverse and opposite traditions, and reasons that the assertion of descent through Joseph cannot disprove birth through the Virgin, since Matthew and Luke did not so regard it. His apology, therefore, while it will unquestionably "fortify the doctrinal conscience" of those who are already orthodox, and of those who are merely disquieted because a favorite dogma has been impugned, cannot be expected to carry conviction to the large number who have rejected the tradition because of their feeling for the legendary character of the narratives on which it is based. To these Dr. Orr's only comfort is that the doctrine is in the manuscripts, of which there are copies by the hundreds.

The attempt to make Paul sponsor for the Virgin Birth must be pronounced farfetched. It is based on Galatians iv, 4: "God sent forth His Son, born of a woman, born under the law." The phrase "born of a woman" means simply human birth, as may be seen from Matthew xi. 11: "Among them that are born of women there hath not arisen a greater than John the Baptist" (cf. Job xvi. 1). But Dr. Orr observes that whereas Matthew uses γεννητός (*sic*, for γεννητός), the ordinary word for "born," Paul employs γενόμενος, "becoming," and in the choice of this word Dr. Orr finds a veiled reference to the Virgin Birth. But the fact is that γενόμενος is altogether too common an expression for simple birth to allow of the slightest doctrinal or unusual connotation. John vii. 58 reads: πρὶν Ἀβραὰμ γενέσθαι. Would Dr. Orr assert the miraculous conception of Abraham?

In one respect, however, Dr. Orr has performed a real service, and that is in pointing out that the Virgin Birth has large doctrinal significance. It has been much the fashion of late to assert that the question was quite unimportant and without bearing upon the doctrinal structure of Christianity. Similarly it was said, when the higher criticism of the Old Testament began first to make its way, that the religious use and value of the writings were not affected. Nevertheless the Old Testament is not the book it was in the Puritan days, and it is well for piety and for the world that it is not. Likewise the views of the person of Christ are destined to undergo great change if the narratives of the infancy are pronounced legend rather than history, and thoroughgoing polemists like Dr. Orr do well to exhibit the doctrinal consequences of a change of view.

Mr. Sweet is less fortunate than Dr. Orr in the arrangement of his work, and goes into the subject in far greater detail. He devotes careful attention to each of the theories which have been advanced to account for the infancy narratives, pronounces them all unsatisfactory, and defends in general the conservative position. His critical skill and appreciation are not sufficient to allow him to do full justice to his theme, this being especially noticeable in his treatment of Old Testament passages.

The virgin birth also looms largely in Dr. Cooke's tractate on "The Incarnation and Recent Criticism." He sees disastrous consequences in the translation and popularization of the writings of such scholars as Harnack, Pfleiderer, Lobstein, and Réville, declares them "old foes with new faces," and refutes their opinions *in toto* and *currente calamo*.

Les Filigranes: Dictionnaire historique des marques du papier dès leur apparition vers 1282 jusqu'en 1600. Par C.-M. Briquet. 39 figures dans le texte: 16,112 facsimilés de filigranes; 836 pages, 4 vols. Genève: Jullien.

This scholarly book will fill with gratitude the hearts of all those whose studies centre about the Middle Ages. The author is a descendant of one of those Huguenots who left France a few centuries ago and did honor to their native country wherever they chose to take their new abodes—in England, in Germany, in Switzerland, in Holland, even in America. For seven generations, members of his family have been conducting business in some branch or other of what they call in France by the general name *l'industrie du livre*. But they did not regard theirs as a mere money-making trade: they have felt for the wares they were handling, books, paper, binding, types, ex-libris, etc., a sort of affection which business men of the modern type could hardly understand. The book now before us is an outcome of this genuine fondness for all matters connected with books. It deals with an almost completely unexplored field of knowledge, *filigranes*, or water-marks. They are made by a copper-wire, shaped in some determined fashion, and pressed on the moist paper pulp.

These trade-marks—for they are nothing else—have been in use ever since the thirteenth century. The fascinating stories that they can tell, few would suspect who have not looked through the four volumes filled with thousands of facsimiles, and have not read the explanations of the compiler. Indeed, the *filigranes* explain some of the mysterious names by which stationers still call certain papers: Crown, foolscap, elephant, post (postman's horn); or in France, papier petit-Jésus, gros-vilain, pigeonne, petit-larron, demoiselle, etc. Often the *filigranes* have disappeared long ago; but stationers continue to call by the same name any paper having the same form or size or color.

It took M. Briquet twenty-five years to complete his collection. He visited all the important libraries, archives, and book collections of France (France was up to the eighteenth century providing paper for all Europe), of Germany, Austria, Switzerland, Belgium, and Holland. He has examined 30,840 volumes and pamphlets, 1,432 portfolios, files, and bundles of documents, and he has taken altogether some 44,000 tracings of *filigranes*. If any one feels that a study of *filigranes* can be nothing more than an innocent mania, like collecting spoons, he need only read the interesting Introduction to see how wonderfully helpful this work can be. A more accurate, and, whenever available, more rapid means of investigation, historians, archæologists, and students of mediæval literature have never known. Often scholars brimming with erudition, and armed to the teeth with philological and linguistic methods, simply cannot ascertain definitely the date of some important document—a date which will throw light on a score of other problems. But, as M. Briquet has classified his material in

the form of a dictionary, an investigator, who can find a *filigrane* in the document can learn from this work by M. Briquet when the *filigrane* began to be used, when it was discontinued, where it was used, by whom. The value of the method has just been tested in Switzerland, by Ad. Fluri. A document of importance, the Chronicle of Justinger, has come down to us in several manuscripts, containing at times widely different readings. For years archivists and paleographs had been vainly discussing the question of the earliest copy. Thanks to the *filigrane*, the problem has been at once definitely settled. Thus Briquet's Dictionnaire will be indispensable in all libraries, in museums, and archives containing documents previous to the seventeenth century.

Queer Things About Persia. By Eustache De Lorey and Douglas Sladen. Fifty-two full-page illustrations. Philadelphia: J. B. Lippincott Co. $3.50 net.

Life in Teheran, as Seen by an Attaché, would be an apter title for this book than that given it by the authors. For it is the simple, but entertaining, record of the experiences and impressions gained during two years' residence in the Persian capital by a young member of the French Legation. M. de Lorey describes his house, his servants, street scenes, bazaars, a dinner at the palace of the Grand Vizier, a reception by the late Shah, and a religious play, "Kassem's Marriage," a veritable Mohammedan Oberammergau. A realization of the strange mixture of the West and the "immovable" East may be had from his account of the return of the Shah from a hunting trip.

> First came the *ferrashes*, carrying whips, and the *shaters*, or runners, in velvet helmets plumed with peacocks' feathers; then came the *Nasakdji Bashi*, or chief executioner, dressed in blood-red, and the *fellekeh* of the bastinadoes, drawn by richly caparisoned mules. All this medley of gay colors, all this pomp of functionaries and soldiers, was surrounding a chariot too strange for the magnificent sovereigns of Iran even to have dreamt of it—*the motor-car of Muzaffer-ed-din Shah.*

Much interesting and valuable information is given in regard to marriage and divorce, and the position of woman, the material relating to the Shah's harem having been obtained from one of its doctors who "lifted for me the corner of the jealous veil which envelopes this feminine city." Brief references are made to the system of government and mal-administration of justice, but there are no references to Persia's relations to the great Powers, or to the reform movement now in progress. Some incidents of a journey in Kurdistan, narrated in the closing chapter, show the normally disturbed conditions on the Turkish frontier.

Douglas Sladen's part in the preparation of the book is best described in his own words. When M. de Lorey had arranged his notes on any subject, "he dictated and I wrote down the chapter, and this time it was I who made the suggestions"; and he adds that their aim was to "present Persia as it presented itself to the eyes of one, who, in the earliest years of manhood, was thrown by the chances of diplomatic life into daily contact with an ancient and effete civilization, which was generally most comic when it was meant to be serious." The numerous pictures, especially those illustrating Persian architecture and gardens, add much to the attractiveness of the volume.

Science.

European Animals. By R. F. Scharff. New York: E. P. Dutton & Co. $2.50 net.

Those who were present at the recent Seventh International Zoölogical Congress in Boston, and were fortunate enough to hear Dr. Scharff's most interesting address on the Geographical Distribution of Animals, will welcome this volume as embodying in full the results of his work. Since the day of Wallace's classics on this subject a number of other works have appeared, notably Richard Lydekker's "Geographical History of Mammals"; but for thoroughness and for general scientific worth in its restricted geographical field, Dr. Scharff's volume will long remain unequalled. It is based on a course of the Swiney Lectures, and hence is as readable and as interesting to the layman as to the scientist. Conservatism marks most of the work, and yet the author advances many new suggestions and generalizations, which he supports by proofs so excellent that few of them can be refuted.

In an introductory chapter, Dr. Scharff discusses geographical history and distribution, and the relation between the two. After a brief review of theories as to the means of dispersal of animals and plants, he says, "We may regard it, therefore, as an established fact that accidental dispersal of a species is the exception, while slow progress on land for terrestrial animals is the rule." In regard to the disputed question of whether the glacial period did or did not exterminate all life in western Europe, the author takes the negative side, treating "that important event in our geological history as a negligible quantity." His theory of the original home of an animal is that it is "somewhere near the centre of its geographical range."

Having thus outlined the broader phases of his subject, he takes up in the remaining ten chapters, various regions of Europe: a chapter each to the British Isles, the Spanish Peninsula, Scandinavia, the Alps, etc. Beginning with Ireland he describes some of the most characteristic animals—and, in spite of his title, the plants—and by tracing them to their original homes, he, little by little, reveals the past geological changes which have affected that island. The fresh water herrings now living in lakes of Ireland, Scotland, and England, not far from the Irish Sea, hark back to a time when these countries were much more elevated, and separated only by a large fresh water lake, instead of the present sea. On the other hand, the Englishman finds in Ireland none of the moles, voles, snakes, unios, and many insects with which he is familiar at home. The former land connection of Ireland with Spain and Portugal is clearly indicated by identical species of arbutus, heather, slugs, spiders, weevils, and dragon-flies. Another geograpical hint of importance is given by certain Irish fresh-water sponges and pearl mussels and the pipe-wort, all of which are found in North America. At the end of the chapter is a summary of the past and present relations of the Irish fauna and flora, with those of other regions, adjacent and remote. This treatment may be taken as typical of the other chapters. The whole forms a comprehensive and yet condensed review of our present-day knowledge of the geographical history and distribution of European life.

A novel as well as helpful feature of the volume is the character of the many illustrations. The majority consist of an outline map of Europe, with a blackened distribution area of some animal or plant, a photograph of which is placed in one corner. The value of such graphic illustration in place of tedious detailed statements of distribution, involving often an intimate knowledge of countries unfamiliar to most readers, is very great. Students will welcome the appendix giving a list of over two hundred works and papers consulted in the preparation of the volume.

"Along the Labrador Coast," by Dr. C. W. Townsend. (Boston: Dana Estes & Co.) is an excellent illustration of what may be accomplished in a short vacation. From July 10 to August 3, 1906, the author skirted the Labrador coast or explored the vicinity of the fishing villages. Even when the mail-boat went ashore for only a half-hour he made a note or two of the birds or trees or human inhabitants. Concerning one of the trees stunted by the cold and storms of this bleak land he writes:

> A black spruce eleven inches tall and twenty-two in extent, with a trunk only one inch in diameter, had lived over half a century, showing fifty-two rings in its cross section. The sturdy little veteran wreaked his vengeance on me by making a great nick in the sheath knife with which I labored to dissect him and learn his secrets.

Many of the author's facts are valuable contributions to our knowledge of the fauna and flora of Labrador. The simple narrative makes enjoyable reading and admirably supplements the more technical "Birds of Labrador," which Dr. Townsend has published as No. 7. vol. XXXIII. of the Proceedings of the Boston Society of Natural History. While travelling primarily as an ornithologist, the author neglected nothing of interest—historical, botanical, or human. Besides the general account, there are chapters devoted to Fish and Fishermen, the Eskimo Dog, Capt. Cartright, the Need of an Audubon Society, and Dr. Greenfell and his Work. A map enables the reader to follow every step of the trip.

W. H. Dudley Le Souëf, author of "Wild Life in Australia" (Melbourne: Whitcombe & Tombs), is director of the Melbourne Zoological Gardens, and has thus had unexcelled opportunities to observe the fauna and flora of this island continent. He takes us from Victoria to New South Wales; thence to Bass Strait, to Queensland, and to western Australia, filling every page with a wealth of fact and anecdote. Those wonderful mimics, the lyre birds, the playgrounds of the bower birds, and the great mound nests of the brush turkeys, together with insects, flowers, native aborigines, and the terrible wille-wille storms which devastate parts of the country—all are described in almost breathless sequence. There are also many pictures. The chief criticism of the book is the heterogeneous

way in which the subject matter is treated, there being no segregation of correlated facts or grouping of related classes. This defect is partly redeemed by two indices, one general, and the other giving the scientific names of all the animals and plants mentioned in the book. One of the most interesting passages relates to a great pit, or depression, in the centre of an island frequented by a large colony of nesting albatrosses. At the bottom of this pit the author found the bones of hundreds of the birds, and it proved to be a veritable death-trap. When an albatross came up wind, headed for its nest across the island, it sometimes swooped too low over the depression. The wind on which it was relying instantly failed it, and before the bird could recover it would strike against the steep side and tumble helplessly to the bottom, from which it was unable to rise and make its escape. This is the first popular book on Australian natural history. which gives a vivid and yet wholly accurate account of the animated life of that strangest of all lands.

An important contribution to ornithology is a memoir just published by W. P. Pycraft on "Some Points in the Anatomy of the Emperor and Adélie Penguins"—part of the natural history report of the British National Antarctic Expedition. The fallacy of regarding the feathers of these birds as directly comparable with the scales of reptiles is discussed, and it is shown that, though scale-like, they are really degenerate feathers of true flight. This theory is also supported by examination of the less specialized wing bones of the embryos in which the thumb is separate and the shape of other bones hints of volant ancestors. The most important discovery is that two sets of down plumage in penguins precede the definitive feathers of the adult. The first is fine, silky, and hair-like; the second is longer and thicker, and very dense, like velvet. In some species this is three inches in length, a special adaptation against the severe cold of the Antarctic breeding places. Mr. Pycraft finds a direct correlation between these three plumages and those of nestling owls and some other birds. If his theories as to relationship with the nestling plumage of birds in general prove correct, we shall have radical changes to make in our heretofore accepted ideas of sequence of plumage from the embryo to the adult. Reviewing our knowledge of the penguin group as a whole, from the giant six-foot eocene types to the little jackass penguin of South Africa, he declares unreservedly that they are all descended from birds with full powers of flight. Finally, he regards the steganopodes as the common ancestral stock from which have descended the penguins, divers, and petrels on the one hand, and the storks, hawks, and duck-like birds on the other.

A new meteorological observatory is to be erected on Mount Marmolata, the highest point on the South Tyrolean Dolomites, and on the border between Tyrol and Italy. The structure is to be built next year under the auspices of the Società degli Alpinesti Tridentini, the largest and wealthiest scientific body in the Italian Tyrol. The Marmolata is 3,360 metres high and is excellently adapted for scientific observations and study.

Drama.

W. S. Gilbert. By Edith A. Browne. New York: John Lane Co. $1 net.

This biography of W. S. Gilbert, in the Stars of the Stage series, is not altogether destitute of sound critical appreciation, but is written too much in the style of the feminine newspaper interviewer to be quite worthy of its subject. It is interesting, however, in the details which it gives of the brilliant humorist's youth and up-bringing, his early literary and theatrical tendencies, his career at school and the London University, and his various disappointments in seeking distinction in the army, the law, and civil service. In these diverse pursuits he acquired the varied experience of life which he was to put to such admirable satirical purpose later on. The book is not at all an adequate review of Mr. Gilbert's abilities or achievements, especially as regards the more serious side of his work, but furnishes well selected samples of his lighter humor in liberal extracts from the "Bab Ballads," several of the poetic plays, and the famous operettas. These will act as incentives to younger readers, as yet unacquainted with his writings, to go to the parent source for further entertainment. Old admirers, of course, will get small satisfaction from them.

Miss Browne gives a pleasant account of the long and brilliant reign of Gilbert and Sullivan at the London Savoy, and of the artistic coöperation to which the representations owed their finish and effect. All that is an old story now. But it is worth while to quote Mr. Gilbert's own words concerning the spirit in which the enterprise was originally undertaken:

> We resolved that our plots, however ridiculous, should be coherent, that our dialogue should be void of offence, that, on artistic principles. no man should play a woman's part, and no woman a man's. Finally, we agreed that no lady of the company should be required to wear a dress that she could not wear with absolute propriety at a private fancy ball.

This resolution they kept, with results which all the world knows. A more scathing commentary on the decadent "comic opera" of to-day could scarcely be imagined. As an illustration of Miss Browne's critical faculty it may be said in conclusion that she puts Gilbert, the sanest of humorists, in the same category with Bernard Shaw and couples Henry Irving with Charles Wyndham.

The Macmillan Co. has reissued Richard G. Moulton's "Moral System of Shakespeare," published in 1903, under the new title of "Shakespeare as a Dramatic Thinker."

The Shakespeare Society of New York has planned a "Bankside Restoration Series," edited by Appleton Morgan and Willis Vickery, as a sequel to its "Bankside Shakespeare." The intention is to print on opposite pages Shakespeare's play and an adaptation of it by one of the playwrights of the later seventeenth century, so that a comparison may easily be made. The value of the scheme may be judged by the first volume just issued, under Mr. Vickery's immediate supervision, containing "Timon of Athens" from the first folio, and the adaptation by Thomas Shadwell (1678). A glance through the pages is sufficient to show that the method is much less fruitful than in the case of such folio and quarto versions as were compared in the "Bankside Shakespeare," for in Shadwell we have a remaking of the play so thorough that only occasionally is the dialogue of the two versions nearly enough identical to repay line for line comparison; and the rearrangement of scenes and introduction of new characters throw out the concurrence so often that in a large proportion of cases one of the contrasted pages is blank. This objection would hold against the scheme, even if it were well executed. But the workmanship of this initial volume is a disgrace to American scholarship. The General Preface and Introduction are negligible in substance and positively illiterate in style. Grammar, spelling, and proofreading are alike wretched. For the texts themselves, they are clearly not to be relied upon. A collation of the first scene of Shakespeare's play with the First Folio, which it seeks to follow *literatim*, reveals some dozen errors. It is difficult to see what good purpose is served by such publications: it is easy to see how much harm is done.

A new edition of R. B. Sheridan's "Rivals" (Thomas Y. Crowell & Co.) makes an attractive volume, with its clear type, fine paper, ample margins, and copious illustrations, and is likely to be in demand as a gift book. Brander Matthews in an introduction furnishes a satisfactory but scarcely necessary refutation of long forgotten and altogether unimportant charges of plagiarism on the part of the author, who, if he, like many another genius, was not above taking an occasional hint from lesser writers, so improved upon the idea as to give it all the practical effect of originality. The pictures designed by M. Power O'Malley are fairly good in draughtsmanship and sufficiently ornamental, but do not possess any specially illuminative or dramatic quality. In facial expression and significance they offer but feeble reflections of the spirit of the text. The notes are of little value.

James MacArthur's dramatization of "The Pilgrim's Progress," which, under the name of "The Christian Pilgrim," was produced in the Liberty Theatre on Monday evening, is a fairly adroit piece of work, and in its rearrangement, sticks closely enough to the original dialogue, which lends itself readily to theatrical adaptation, to preserve the literary quality practically intact. On the whole the representation embodied the spirit of the original work more faithfully and sincerely than was, perhaps, generally expected. There was abundant evidence of a serious and artistic intent behind it, but, as might have been foreseen, the spiritual motive and purpose were least discernible whenever they became the excuse for the most elaborate spectacular illustration. In the scenes in "Vanity Fair" and in the enchanted retreat of the Wanton the interest was purely theatrical, not at all literary or moral. But during the episodes of the flight from the City of Destruction, Christian's passage of the Wicket Gate and winning of the Cross on the Hill, the arming in the House Beautiful and so on, the play was actual-

ly an enactment of the allegory, and exercised the same sort of religious and emotional influence as was exerted by "Everyman." At no time did it degenerate into mere futility and mockery. Miss Crosman, Mr. Roger, and Mr. Mackay spoke the dialogue with comprehension and effect, but the elocution of many of the performers, notably that of the leading man, Tyrone Power, was exceedingly poor. In the case of Mr. Power, who assumed several leading characters, Beelzebub, Apollyon, Hategood, and Giant Despair, with but little sense of characterization, this defect was serious. To the general public the piece will appeal most strongly by its spectacular and musical features, which are uncommonly good in their way, but it is none the less deserving of consideration as an artistic effort.

Music.

Stories of Symphonic Music. By Lawrence Gilman. New York: Harper & Bros. $1.25 net.

Previous to Beethoven, symphonic music was little more than the melodious weaving of pretty tone patterns, without any emotional purport or pictorial suggestiveness. Beethoven deepened the emotional import and made a few attempts at pictorial delineation, the most famous of which is the Pastoral Symphony; in this he intends the music to illustrate successively the "awakening of joyful impressions on arriving in the country"; a "scene by the brook"; a "merry gathering of country folk"; "a thunderstorm"; and a "shepherd's song: glad and thankful feelings after the storm." It is true that after penning these indications of his realistic intentions, he had an access of repentance and wrote that his music was intended to be "more an expression of feeling than painting"; and this deprecatory afterthought caused pictorial or "programme music," as it is generally called, to be looked on by the conservatives for many decades as only semi-respectable. Nevertheless, the fact that Beethoven had actually written such music encouraged Mendelssohn to compose his "Scotch" and "Italian" symphonies, and his "Hebrides," "Melusina," and "Calm Sea" overtures, which made Wagner call him "a landscape painter of the first order", and after him the tide rose gradually until absolute (non-pictorial) orchestral music was swept away almost completely. Berlioz, Liszt, Raff, Spohr, and others were among the pioneers, and all the prominent composers excepting Brahms followed in their footsteps, at least in some of their works.

At the present day orchestral conductors seldom arrange a programme that does not contain some "programme" music; sometimes the "programme" is printed in the programme, but often it is not. In the latter case an injustice is done to the hearer as well as the composer, an injustice almost as great as that perpetrated by a vocalist who sings a song in such a way that the words cannot be understood; for, as Ernest Newman has aptly remarked: "If the poem or the picture was necessary to the composer's imagination, it is necessary to mine." There ought to be some way of compelling concert organizations to print the necessary information. Mr. Gilman's new book, "Stories of Symphonic Music," will save them the trouble of compiling the requisite information. To be sure, our author rather deprecates the "efforts of many persons in the audience to extract from programme notes and analyses information as to the dramatic or pictorial or poetic meaning of the music to which they are listening," on the grounds that there is no time for such effort during a concert, and that it is likely to distract the attention of the hearer from the music. There is something in that, too, and we cordially agree that the best thing for every concert-goer to do is to get a copy of Mr. Gilman's book and prepare himself beforehand.

It is a good book, up-to-date, like all of Mr. Gilman's writings. In fact, we fear it is, in not a few of its sections, rather too much up-to-date. The author is ultra-modern in his taste, and he includes in his pages not only symphonic works which are part of the standard repertory, but "such others as seem likely to become so." Among these is the first piece he describes, "The Witch of Atlas" (based on Shelley's poem), by Granville Bantock, an English composer quite neglected so far in our concert halls. Considerable space is given to other pieces now seldom or never heard at our concerts—works by Converse and Hadley, in particular. These are Americans, and so are three others (Chadwick, MacDowell, and Loeffler) in Mr. Gilman's list of thirty-four composers of programme music. Of Liszt's symphonic poems seven are described, while Wagner is represented by the "Faust Overture" and the "Siegfried Idyl." Huber's second symphony was perhaps worth including in this book as an endeavor to compose a tonal commentary on a famous painting; yet, in this, Huber's work was anticipated by Liszt's "Battle of the Huns," which was inspired by one of Kaulbach's frescoes representing the aerial battle between the ghosts of the slain Huns and Romans in the year 451.

American composers and students may find much in Mr. Gilman's volume of interest to them as marking the trend of modern music. We would call their attention particularly to the pages describing the four symphonic poems of Saint-Saëns. That Frenchman, better than any other writer of pictorial music, knew how to condense and present the programme for his music. His "Phaëton" is a model for all composers—a sketch which irresistibly invites a musical setting and makes it easy to follow:

> Phaëton has obtained leave to drive his father,'s, the Sun's, chariot through the heavens. But his unskilful hands lead the steeds astray. The flaming chariot, thrown out of its course, approaches the terrestrial regions. The whole universe is about to perish in flames, when Jupiter strikes the rash Phaëton with his thunderbolt.

What Mozart is among composers, Mme. Sembrich is among singers; her art is always pure, lovely, serene, and though a cloud may occasionally appear on the horizon, it is never a storm cloud. The nearest approach to dramatic emotion on her Tuesday afternoon programme at Carnegie Hall was Schubert's "Gretchen am Spinnrade," and the pathos of this was not fully revealed either by her or by her accompanist, Isidore Luckstone, who in all the other songs was admirable. Mme. Sembrich is at her best in songs of light calibre, and nearly all she sang were of this kind; those that had a dash of the comic pleased her large audience particularly. She is mistress of six languages, and sang in them all—Italian, German, French, English, Russian, Polish. Though she now occasionally needs the art of concealing art, she is still the greatest living representative of the *bel canto*, unless the tales regarding Mme. Tetrazzini cabled from London are true.

Jan Kubelik experiences no difficulty in playing any music ever written for the violin; the most stupendous feats seem child's play in his hands. Much more difficult is the rôle he has to play before the public and the musical experts. The public —as represented by an audience of over five thousand persons at the Hippodrome last Sunday—wants to see him exhibit dazzling fireworks *à la* Paganini, while the musicians sneer at him as a mere virtuoso if he gratifies this wish. The problem is how to get both the pay of the public and the praise of the critics. The programme attempted to solve this problem; it included the Sinding concerto, a Beethoven romanza, and the "Havanaise" of Saint-Saëns. In this music he showed that his art has ripened, that he can now play with expression as well as with skill. Yet he himself, like his audience, was much more at home in the final piece, Paganini's "Witches' Dance." In this, all the tricks of the trade are exemplified, and by his marvellous manipulation of them the juggler provoked the wildest enthusiasm.

Professor Kopfermann, head of the musical department of the Berlin Royal Library, has discovered Mozart's seventh Violin Concerto, which was hitherto believed to have been lost. Professor Kopfermann has edited the concerto, and it was performed for the first time on November 4 in Berlin.

Dr. Edmund Hart Turpin, who died in London on October 25, was one of the best known English concert organists and musical journalists. He had been for thirty-two years honorary secretary of the College of Organists. He was born in 1835, at Nottingham. In 1888 he was appointed to the post of organist of St. Bride's, Fleet Street, which he held to the last. He was for several years editor of the *Musical Standard*, and subsequently of the *Musical News*. As a lecturer he was also much in demand. His compositions are mostly of the ecclesiastic order (oratorios, masses, cantatas, anthems), but there are also secular works—piano pieces, quartets, and a "Monastery" symphony.

Vicomtesse Vigier, formerly Sophia Cruvelli, the famous prima donna, died at Nice November 6, aged eighty-one years. She created the leading rôles in Verdi's "Ernani" and "Attila."

Art.

THE WATER COLOR CLUB EXHIBITION.

The exhibitions of the New York Water Color Club are always smaller than those of the American Water Color Society, and it cannot be said that there is any special difference in the point of view represented by the two bodies. The strongest work in

each exhibition is likely to be by the same men. The club includes in its present exhibition pastels which give a different shade to its walls, but the growing use of opaque colors renders it difficult, at times, to distinguish at a glance whether a given work is in pastel or in gouache. Perhaps the standard of this exhibition is a little lower than that of last year's Society showing, but there is good work in it, and certain new-comers are more conspicuous than they might have been in the larger exhibition.

There is, as always, the interest of seeing how the same men get far more beautiful color when they paint in water-colors than when they handle oils. To those who are in a position to know of experiments now being made, it is evident that the lesson is at last being taken to heart, and that painter after painter, who has been brought up in the superstition of "direct painting," and has floundered in mud or chalk for years, is beginning to understand that something is to be said for the traditional methods of oil painting. Painter after painter is beginning to see that there is a special beauty in transparent and translucent color, which is absent from opaque pigment. Unless signs fail the day is at hand when color, for its own intrinsic beauty, and workmanship, also, will reappear in the art of painting in oil.

Instances of the sort of thing oil painting has lacked, in our day, are to be found plentifully enough in almost any water-color exhibition. Take as an instance, here, Otto C. Wigand's, Early Spring, No. 237. Mr. Wigand is a painter in oils whose work is always to be seen in our exhibitions and makes a respectable, if not a distinguished, figure there. If he could give it such charm of color, such fullness and delicacy, at once, as he has achieved in this little watercolor, he would be recognized as one of our foremost painters. Or take Alethea Hill Platt's On the Edge of Dartmoor, No. 101; Mary Langtry's Warm Sunlight's Glow, No. 398 (a picture singularly misnamed, as it is a twilight scene), and the same artist's picture of a white duck absurdly entitled "And scurvy care is dead to such as we," No. 252—all three of these drawings have a decorative color quality—a quiet richness—of which few of our painters in oil, except Maxfield Parrish, who paints almost entirely with transparent color, are capable. These are far from the only examples of what I mean; examples are everywhere. There are bits of still life, flower pieces, all sorts of things by quite undistinguished persons which show the advantage of working in a medium in which stupid prejudice does not forbid the use of real color. It is only in the case of those who are going into the extreme use of pure gouache that watercolor painting is in danger of becoming as lifeless as is much of our modern painting in oils.

Many well-known artists are represented in the exhibition by characteristic works, like F. Luis Mora's brilliant Vacation Time, No. 339, awarded the Beal prize, which has all of his dash, if something less than his occasional subtlety, or Henry B. Snell's Rainbow, No. 363, in which the illusion of light in the bow itself is striking, but is gained at some sacrifice of the quiet beauty of the rest of the picture. On the whole, one likes better his less striking Gray Weather, No. 254. Genjiro Yeto, from painting Japanese subjects in an impressionistic manner, has taken to painting American flowers in a Japanese manner, and the result is delightful.

A systematic review of everything worthy of notice in the exhibition would require more time and space than are at my disposal. Let me conclude with a welcome to one or two new names. Charles Emile Heil is represented by four examples, all of which are interesting. Repose, No. 197, and Laborers Homeward Bound, No. 395, are based on strong charcoal drawings, full of character, washed over with transparent colors. If there is any such drawing under Nos. 73 and 117, Child and Turkeys and The Golden Gown, it is effectually hidden. Both have a curious, stencil-like technique, which is very effective in rendering the glitter of the feathers on the turkeys' backs and the embroidery on the gown. The flesh-modelling in No. 117 is hard, but there is a certain distinction in the drawing. In all four of Mr. Heil's pictures the flesh is rather brownish, and less successful than the accessories. On the whole, he seems to be a person with something to say and a personal way of looking at things, and his work has a decorative intention that is welcome. One will hope for more and still better things from him.

Finally, one of the best things in the exhibition is the Checkered Dress, No. 173, by Hilda Belcher, an entirely new name. It is delightful in tone, charming in characterization, well drawn, and unusually successful in the rendering of flesh—a difficult task in water-color. There is nothing here more quietly beautiful or which one would more strongly wish to carry away.

KENYON COX.

Lemcke & Buechner are the agents in this country for the new dictionary of artists, "Allgemeines Lexikon der bildenden Künstler von der Antike bis zur Gegenwart," edited by Dr. Ulrich Thieme and Dr. Felix Becker of Leipzig, with the cooperation of 300 specialists of Germany and other lands. This great work is to be completed in twenty large volumes, the first of which has just appeared ($8 net).

The most important contribution to the literature of art that the Metropolitan Museum of Fine Arts has made lately is a catalogue of the Morgan collection of Chinese porcelains. The tabulations are reprinted with additions from an earlier edition for private circulation which was printed by Robert Grier Cook in 1904. The new issue, which the museum publishes, contains an historical introduction by Dr. Stephen W. Bushell, a new preface by William M. Laffan, and a series of full-page halftones. In the preface Mr. Laffan says:

> The purpose of the present catalogue is to afford to those interested in the subject of Chinese porcelain an opportunity to study the objects exhibited in the Morgan collection in the light of the latest knowledge that is to be had on the subject. The collection is the most comprehensive that is known, and it has been described as succinctly and lucidly as appeared possible, without any technicalities that could be avoided.

Among the recent accessions in the Metropolitan Museum of Fine Arts are two collections of Egyptian antiquities, one of 187 pieces, which was acquired by purchase, and the other, of 29 pieces, secured under the Egyptian Research Account.

The excavations at Paestum, which have been carried on since last spring, have yielded some remarkable results. Paestum, the Greek Poseidonia, was founded about 600 B. C., probably by Troezenians who were driven out of the city of Sybaris by the Achæans. For a long time it was one of the most flourishing Greek cities, and it was not until the third century B.C. that it lost its independence and became subject to Rome. In our own times it is known chiefly for its three magnificent temples, the largest of which, the temple of Poseidon, dates back probably to about 500 B. C., and is one of the finest and best preserved examples of Greek Doric architecture. The fact that Paestum was for a long time an important Greek city, and had not yet been explored by modern archæologists, made excavations on that site especially alluring. Prof. Vittorio Spinazzola of the University of Naples obtained permission to investigate the site and in three short months brought to light a large quantity of most interesting remains. The first thing discovered was the great central road, thirty-six feet wide, composed of large polygonal blocks, with its paths still intact. It passed behind the two great temples, and has been uncovered for more than 405 feet. In the neighborhood of the temples many fragments of cornices and terra-cotta ornaments have been found; also large fragments of terra-cotta which form a frieze three yards long. These are adorned with five lion heads and beautiful designs of spirals and flowers, and are painted red and brown, the colors well preserved. It is probable that this frieze is part of the cornice that crowned the temple. About seventy-eight feet from the altar which stands in front of the later temple, commonly known by the name of the Basilica, were found a large number of objects dating from prehistoric times down to the Roman epoch: primitive weapons of the stone age; bracelets and ornaments of the bronze age; a rude idol in the form of a bearded god, with round eyes and archaic smile; archaic inscriptions and manifold remains of later times. Great expectations are entertained of the results of the excavations this coming winter.

It had been planned to celebrate the fiftieth anniversary of Rome as the capital of Italy in 1911 by a great international archæological exhibition in the Baths of Caracalla. For this purpose the Baths were to be elaborately reconstructed in cement and wood and given as much as possible their original appearance. This project, however, found many opponents, and it has now been proposed to spend the four million francs which it would take to reconstruct the Caracalla Baths on the complete clearing of the Baths of Diocletian. All the little houses which have been erected on the site should be pulled down and the old walls brought to light again. The large halls, which are still partly covered, should afford plenty of room for the archæological exhibition, and the same rooms could later be used to house some of the collections which have been crowded into the Museo delle Terme.

In the *Notizie degli scavi* L. Pernier gives an interesting account of important Etruscan finds which have recently been made in the neighborhood of Corneto Tarquinia. A rich Tuscan landlord, Vincenzo Fioroni, undertook excavations at his own expense, both at La Cività and near the hill Poggio dell' Impiccato. At the latter place more than one hundred tombs were discovered, of which eighty-four were found to be intact. The methods of burial were varied. Some of the graves were cylindrical holes cut into the rock and protected with a stone lid; others were movable stone jars stuck into the ground; others, again, consisted of large square chambers covered with enormous blocks; and finally there were discovered several monolithic sarcophagi. The contents of the graves were likewise varied. Among the numerous weapons the helmets are specially noteworthy, both for their number and for their form and artistic decorations. A great variety of fibulæ (brooches), bracelets, terra-cottas, and vases were also found, as well as the characteristic hut-urns.

We have received from Jacques Reich of this city the remarque proof of his etching of George William Curtis, the latest addition to the series of distinguished Americans, in which the portrait of Schurz was so admirable. The etching of Curtis represents him not as he was when he thrilled the Republican convention in 1860, but in his later years, and his sterner aspect. It has not the charm of other portraits of Mr. Curtis.

Among the exhibitions at the dealers' shops in this city is a collection of Rembrandt's etchings, most of them picked up in Europe during the past summer, at Frederick Keppel & Co.'s, on view till November 30; etchings and lithographs by Whistler, H. Wunderlich & Co.'s, till November 30; paintings by August van Tack, Macbeth's, November 24.

Finance.

THE AFTERMATH OF PANIC.

The spread of the New York panic throughout the rest of the country; the deficit in New York bank reserves (below the 25 per cent. ratio) of $38,838,000 on November 2, and of $51,924,000 on November 9—both figures quite unprecedented; the repetition of the premium on currency witnessed in 1893 and 1873—these successive events of the past two weeks have merely duplicated, on perhaps a larger scale, the similar incidents of preceding panics. Some experiences which followed the New York panic in those other years have not yet been repeated; notably the failure of small banks and mercantile institutions throughout the interior. The reason is that the partial suspension of credit throughout the country has brought all enterprise, solvent and insolvent, to a sort of equality. During the crisis, the country's strongest banking institutions practically pooled their resources with the weakest. Through this joint use of credit, collapse of ill-protected banks and industrial concerns has been prevented, or at all events postponed. It will be when the measures of emergency relief are no longer necessary, and when the regular course of business has been resumed, that all institutions and individuals will be brought to what Western markets call a "show-down." When this real test of solvency comes, many of the weaker or "over-extended" undertakings may be forced to the wall.

In the past week, the event which has in many respects been more sensational than anything of the sort in previous panics has concerned the relations between New York and financial London. When trouble was at its worst in the fourth week of October, all experienced financiers agreed that large recourse to Europe's gold supply would be inevitable. Certain conditions favored such a method of relief on a substantial scale and on a strictly commercial basis. The Bank of England, which, as long ago as the middle of summer, had begun to strengthen its own position through exaction of an unusually high rate of discount, had accumulated an exceptionally large stock of gold and had raised its ratio of reserve to liabilities to the highest figure reported in that month in half a dozen years. On the other hand, our country was fortunate in having a fair surplus of wheat, which the outside world would presumably be compelled to buy at the seller's prices. So far, then, the means of obtaining foreign gold seemed to be well provided; in fact, perhaps $10,000,000 gold was engaged at London, during the early stages of the panic, with exchange on that city holding at rates which abundantly justified such shipments, and with export of agricultural commodities, and sales for future export, reaching unusual magnitude. But the New York market either would not or could not wait. Banks and bankers, accordingly, as was noted in this column last week, offered as high as 3 per cent. premium for imported specie. On this wholly artificial basis of exchange, no less than $40,000,000 gold was started from London on its way to New York city.

The Bank of England, from whose reserves the greater part of this gold had been withdrawn, advanced its rate to 5½ per cent. on October 28, and to 6 on November 4; and on Thursday of last week it broke all precedents since the world-wide panic of 1873 by raising the rate to 7. On the same day the Bank of France fixed 4 per cent., the highest since the Boer War panic of 1899; and on the ensuing day the Bank of Germany went up to 7½, the highest figure in its history. These extraordinary rates, while partly designed to meet conditions in Europe's own markets, especially at Berlin, nevertheless were primarily directed to regulating the New York demand for gold. Exactly what the withdrawals by New York signified to the Bank of England may be judged from the fact that last Thursday's weekly statement of the Bank showed a loss of $30,000,000 gold within a fortnight, and a fall in its ratio of reserve to liability, from the comfortable figure of 49⅜ per cent. on October 17, to 35¼ on November 7. The second of these figures, though below the traditional 40 per cent. minimum, was nevertheless no lower than has been reached occasionally even in recent years. But those instances were due to temporary causes, such as the large December settlements at London; in the present case, nobody could tell how long this extravagant American demand would last. The Bank of England possessed no means of protection except its discount rate.

When the strain is over—always supposing serious trouble does not break out in Europe itself—it may be confidently predicted that these high bank rates will gradually drop, and that the foreign money markets will resume a normal course. Meantime, however, the remarkable movements above described, and the continuance of gold withdrawals from Europe for New York during the present week, raise the question: What has become of all the gold which lately seemed to be flowing into the world's reserves? The world's gold production during 1906 broke all records, and production this present year, so far as America and the Transvaal are concerned, has run beyond even 1906. Moreover, the Treasury estimate of this country's actual money circulation, published a few days ago, showed that during October, the month of panic outbreak, the gold in the United States increased by $6,700,000, and that the total supply of all sorts of currency was enlarged by $14,000,000.

These figures include the holdings of the Treasury. If they are omitted, so as to indicate the amount of currency in actual circulation (on the markets or in bank reserves) the comparison is far more striking. Owing in the main to the large deposits made by the Treasury last month in banks, here and elsewhere, the total supply of money in the United States, outside the Treasury, increased between October 1 and November 1 no less than $70,500,000. In other words, during this very panic period the circulating medium has been increasing with extraordinary rapidity. What has become of it all? And, in particular, how is it possible that when money enough was on hand a month or two ago, there should now be so excited a scramble for the reserves of all the great banks here and abroad?

No doubt actual hoarding by individuals accounts partly for this sudden need. The difficulty has not been complicated, as in 1857, by the sudden removal, from circulation, of notes of banks which had suspended payments. But when due allowance has been made for private hoarding—the amount, perhaps, in the whole United States, may have reached $30,000,000 or $40,000,000—the fundamental cause of the present urgent demand still remains to be pointed out. In times of easy credit, relatively small reserves in cash suffice as a basis for large superstructure of bank liabilities. The country banks, under the national bank law, deposit at New York or other cities three-fifths of their 15 per cent. required cash reserve; trust companies work under an even smaller margin of actual cash in their own vaults. Each institution leans on the credit of some other, without provoking distrust. But once let general doubt about banking credit spread throughout the country, and each fiduciary institution will try to collect at once into its own vaults as large a stock of cash as possible. Reliance on other banks where reserves have been redeposited is not enough. Indeed, the panic of 1893 showed plainly to the West and South that a solvent country

bank might be forced to close its doors through inability to obtain cash due it from a solvent city institution. The result of a precautionary hoarding of currency by the banks of a hundred cities is that supplies of currency which, a month ago, were ample for the market's needs, are now entirely inadequate.

It may be asked: How shall we find relief? The answer must be sought in the history of former panics. When excitement quiets down; when the sheep and the goats have been separated in the ranks of firms and institutions; when the community as a whole has regained its confidence in such institutions as survive—then the currency hoarded by individuals will return to the bank reserves, and institutions which have been holding unusually large quantities of cash to meet the crisis will gradually relax their grip on the money. It will once more flow to the larger city markets, and from there, if former experience is a guide, will go back to Europe in the form of gold. But time is required for this process of recovery.

IN PERIL of CHANGE
By C. F. G. MASTERMAN

THE NEW HUMANISM
By EDWARD HOWARD GRIGGS

B.W. HUEBSCH, Publisher, N.Y.

Now Ready

William Pitt; Earl of Chatham

By ALBERT VON RUVILLE

Privat-Dozent at the University of Halle

3 Vols. 8vo. With Portraits. $9.00 net.

This monumental work on Pitt explains the course of his life by replacing him in the environment which made him what he was. It is, however, very much more than a mere account of public affairs during Pitt's lifetime. A lively picture of the manners, the society and the morality of the age is sketched in with the sure, firm touches of a writer completely master of his subject.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 21, 1907.

The Week.

One phrase in the President's letter to Secretary Cortelyou in regard to the bond and note issues will, we think, provoke remark. "The government," he wrote, "*will see* that the people do not suffer if only the people themselves will act in a normal way." It is, of course, a consistent Republican theory that this phrase expresses. The party has always assumed that its measures were the *sine qua non* of prosperity. Now that a depression has set in, the party naturally feels compelled to assert its power to defend the faith. Of course, it cannot. Relieve the money stringency it may, but no widespread depression is to be conjured away by promises that "the government will see to it." That is an unwise pledge, from the point of view of politics as well as of economics. As the New York *Journal of Commerce* put it Tuesday, Mr. Roosevelt's attempt to conceal a serious situation by saying that crops are good and business conditions are sound, and by urging people to be normal, is only "applying the Christian Science doctrine to the finance and business of the country which has been for two or three years working into a disordered condition and needs careful and judicial treatment."

Mr. Bryan's announcement that he will not seek, but is ready to accept, another nomination for the Presidency, will arouse almost every conceivable emotion—except enthusiasm. The general feeling, if he should run again for the Presidency, would be like that of the returned English officer in the story, who, when he was asked to go and see the House of Commons, inquired, "Is that thing going on yet?" The advantage of having a new man as a candidate is often very great. He provokes interest. Everything printed about him is read; his speeches are closely scanned. This was the good fortune of Mr. Bryan himself in his first campaign. But after eleven years of it, that curiosity is now rather more than sated. With a fresh nominee, too, there is always the possibility of enlisting hope. People are optimistic in the case of a new man. He will do better—the new broom will sweep away the old cobwebs. But Mr. Bryan, instead of causing hope to spring eternal, would make dejection sit like an incubus on every breast. During half a generation citizens have now formed the habit of voting against Mr. Bryan, and such habits are fearfully hard to break. Mr. Bryan makes a great parade of appealing to "the rank and file" of the party. He says he is not going to be guided by the opinion of newspapers "calling themselves Democratic." The mandate that he will obey must come, if at all, from the plain people in the party. The fact which Mr. Bryan doubtless has in mind, that a great many Democratic papers in the South have been outspoken against his candidacy, cannot be dismissed as a mere vagary of their editors. It speaks, rather, of a widespread feeling. If Mr. Bryan is named for the Presidency next year, it will be due to skilful use of the "organization," not to any spontaneous demand of the mass of Democrats, North or South, plain or fancy. From beginning to end, Mr. Bryan's manifesto harps on "availability." But the real objections to him go deeper than any weighing of the chances of success. He might be "sure to win," and yet we should have the same conviction that he is not the man for the Presidency. He has shown himself as unstable as water and as dangerous as fire. He speaks smoothly of "Democratic principles," but any definition of them that could pass outside of a lunatic asylum would shut out such enormous centralization of power as is involved in his scheme for government ownership of railroads. A determined rally of a few States would make his candidacy impossible. The question is, What are self-respecting Democrats going to do about it? They will have to answer very soon.

The Administration has no more difficult task than to decide when to hold an election in Cuba and set up the new government which it is bound to put into power. The understanding has been that this step should precede our own Presidential election in 1908. Now there is reported a growing demand from various sources in the island for an early election; and the preliminary census has been just completed. It does not seem possible that the government can please all the parties in Cuba. Some will think the day chosen comes too soon, others too late, and those who desire a permanent intervention will naturally not be satisfied at all. The discouraging fact seems to be that, during this interregnum, no one strong man has come forward who is entitled to the office of President by reason of his sagacity and ability. The danger is, of course, that, if a member of one of the present factions is elected, the others will start a revolution. The Cuban police and rural guards have, we understand, been greatly improved of late, and if in connection with the election there could be an agreement that American officers should be placed at the head of the Cuban forces in order to keep the peace, there might be some chance of a government's surviving for a while. Whether such an arrangement could be worked out is problematical, for the reason that every President would naturally wish to control the head of the military. If only some Cuban Diaz would appear, Gov. Magoun, we feel sure, would rejoice. It is pleasant to record that, according to all accounts, the American government of Cuba has been of an excellent character, while the conduct of our American troops deserves the warmest commendation.

Oklahoma does not enter the sisterhood of States in the best of tempers. She feels rather like an unconventional but entirely worthy member of the family who has been kept waiting interminably in the vestibule. She has had the added vexation of overhearing scraps of the conversation from upstairs. "Oh, she can wait." "We're expecting Arizona presently; let's have them both shown up together." "She can't possibly have grown up. I remember her as a particularly obstreperous baby. Hadn't she better eat with the children?" There is some excuse for this feeling. We never kept any other Territory half so well qualified for Statehood on probation so long. Yet the whole summer's gossip about the President's possible refusal to approve the new Constitution doubtless rested on a very small basis of fact. Plenty of Republicans wanted to keep the Democrats out for a year or two more, and there were enough debatable provisions in the Oklahoma Constitution to serve as excuses. That the President would consent to this kind of political scheming, especially when its victim was a commonwealth which he held in such friendly esteem as Oklahoma, was altogether unlikely. Gov. Haskell has declared his intention of reorganizing the administration slowly, and of being impartial in the designation of State depositories, and the like. If he carries out his purpose, his course will be in refreshing contrast to the petty political machinations of some of the opponents of Statehood.

The proposal for a national park on the Hudson, for the preservation of the Highlands from Peekskill to Cornwall, should take more account of the possibilities of the tract as a forest reserve. Romantic the region is, and not without historic associations; but so grave has become the shortage in lumber that no new national reservations should be created which do not aim to stop or make good the senseless deforestation of our lands. That the lumber consumption of

the country has increased more rapidly than our population is to a considerable extent due to the destruction of forests for the making of wood-pulp paper. But, whatever the causes, the astounding fact remains that enough lumber has been cut since 1880 to make a one-inch floor over an area of 25,000 square miles. Such lavish use of lumber cannot, of course, continue without serious industrial results. The railways are feeling the pinch when they buy their ties, and so are manufacturers of furniture, cooperage products, vehicles, and builders of all kinds. If they were aware that there is only fifteen years' supply of hard wood now available for cutting, their present anxiety would be far greater. The time is, therefore, ripe for urging the increase of our forest reserves, not only by the Federal Government, but by the States as well. New York, for instance, ought to assume jurisdiction over the Lake George mountains and shores. That region is practically useless for farming purposes, but for forestry is of greater value than the newly proposed Hudson River park. In Michigan, a beginning has been made in the work of preserving some timber lands by the appointment of a commission of nine to investigate the whole matter and report to the Governor. But before the nation as a whole the all-important matter is the creation of a national forest reserve in the Appalachian and White Mountains. A bill authorizing the acquirement of the necessary territory passed the Senate, but failed in the House. Congress did, however, appropriate $25,000 for a thorough examination and survey, and a definite plan is now ready for submission to Congress when it meets next month. Costly the purchase of the necessary land indubitably will be. Nevertheless, the Appalachian reserve bill should be carried through Congress at the earliest possible moment.

"Dr. Wiley, the government's so-called 'food expert and reformer,' is as much responsible for the present demoralization of a great mass of the business of the United States as any one person in the country." This charge, from the lips of the counsel for the American Extract Manufacturers' Association, has a familiar ring. The present state of public feeling is such as to make the cry of "disturber of business" an effective slogan for every cause, no matter how selfish its motives. Against last year's food law, made inevitable by the Chicago stock-yard revelations, people raised the wail about America's diminishing exports, on the theory, presumably, that just as all party differences must be forgotten in the face of a foreign enemy, so all possible moral scruples, with regard to the vending of tainted food, must be forgotten in the face of a foreign customer. What, after all, do Dr. Wiley's critics demand, in the last analysis, but the right to sell an article under any name but the one by which it is known to its maker? Men in high office have been justly censured as "disturbers of business" because their zeal has far outrun their discretion or the necessities of the case; but it is still to be shown that the head of the Agriculture Department's Bureau of Chemistry has, according to assertion, "destroyed food values to the extent of many hundreds of thousands of dollars by unfair methods."

Writing on the subject of "Aids to Contentment in the Navy," Rear-Admiral Goodrich has contributed some valuable suggestions to the Naval Institute's *Proceedings*. There is, it appears, considerable discontent in the navy, as well as in the army, and Admiral Goodrich joins Lieut. Ridley McLean, who has also written on the subject, in believing that the features of naval life which cause the greatest discontent are unnecessary ones. Primarily, Admiral Goodrich feels that the navy, in its treatment of its men, has not taken note of the changes which have revolutionized society during the last one hundred years. He finds that the attitude of the average naval captain towards his men is about what it was in 1861, although during that time the duties of crews have undergone a marked change. For instance, of the crew of the steamer Tennessee in 1880, 81.2 per cent. was made up of seamen, only 14.9 per cent. being in the engine-room, or artificer's branch. To-day, the Maine, out of a crew of 670, carries only 334 seamen, or less than 50 per cent., while 39.1 per cent. are in the engine-room and among the artificers. Moreover, the seaman of to-day bears to his predecessor of 1880 only a slight resemblance. The modern ship is a floating machine shop, and her crew ought to be treated as high-class mechanics, and not as were sailors in the time of Marryat. Then they were imprisoned on board men-of-war, as if they were convicts, and certain to get drunk or to desert if allowed to go on shore. To-day, confinement on a ship is more irksome in some ways than formerly, because the friends of a sailor have so many more pleasures and opportunities than did the corresponding classes a hundred years ago. Moreover, sailors are now dressed as they were a century ago, and are often compelled to change their clothes—if they are in the engineering department six times a day, or more. Rear-Admiral Goodrich would have them wear working clothes all day, and change to clean at night. He would compress all work into the hours between 8 A. M. and 5 P. M., and then devote the rest of the twenty-four hours to sleep and recreation. If the ship is in a home port, he would allow all but one-quarter of the crew to go ashore every night, and stay, if they wished, until seven o'clock in the morning. Finally, he would have Congress permit the navy to punish offenders by imposing fines, as in the army, and would do away with the deprivation of liberty as a punishment. All of which appears to the civilian ashore sound and sensible, in keeping with the times. The wonder is that such views have not long prevailed.

That the present football season has been a notable improvement upon its predecessors no observer can deny. Primarily, there have been fewer injuries than for years. Such casualties as have been reported have been mostly among the players upon "scrub" teams. The absence of serious accidents is the more noteworthy because opponents of the present game were certain that the open style of play would be more dangerous than the crush of a mass play. The event has shown that the facts are on the other side. It is also gratifying to learn that the conduct of the players has been better. There have only been isolated instances of deliberate "slugging" or foul play. Undoubtedly, this is partly due to the extra umpire and to increased official vigilance; but whatever the cause, the result is welcome. As to the game itself, last year all the teams were unfamiliar with the open style of play, and even the most skilful players failed to grasp the possibilities behind the new rules. This year the benefits are clearly visible, and the game appears transformed from that of two years ago, when twenty-two "beefy" players shoved each other up and down the field. Now lithe and active men are sought. Moreover, the player is compelled to use his brains to a far greater extent than heretofore. The variety of plays and their ingenuity are amazing after the years of tandem-smashing through right or left tackle or the guards, varied by an occasional punt. From the spectator's point of view, the game is also vastly improved. The forward pass is but one of several new plays which add to the interest and keep the ball always in view. Finally, the new rules have brought about a greater equality among the teams of large and small colleges. While conceding all these improvements in the sport this season, the *Nation* is still opposed to intercollegiate football contests. Their inherent evils are not affected by the fact that the playing rules have been improved, and that the list of injuries has shrunk. The over-emphasis upon athletics continues. The excitement of the undergraduate world during the football season remains. It is still true, as a Harvard professor said last year, that no solid work can be got out of the classes until the Yale game is

over. All of the arguments against the game that President Eliot has marshalled with such telling effect are still of force. Nothing has happened which should cause the Columbia University authorities an instant's regret over the stand they took last year in forbidding football.

Catholic authorities in this country, as well as abroad, are, outwardly at least, conforming to the injunctions of the Pope's encyclical against "Modernism." The trustees of the Catholic University at Washington have recently passed a formal vote against the teaching of Modernist heresies in that institution. Father Tyrrell, the English Jesuit of liberal leanings, who in two able articles in the London *Times* replied to the arguments of the encyclical, has just been sentenced to what is known as the "lesser excommunication." Under this punishment he is forbidden to approach the sacraments, though he is not barred from ordinary communications with the faithful. The sentence has deeply stirred Father Tyrrell's admirers, who regard him as the Roman Church's "greatest master of English style and her subtlest apologist since Newman." Moreover, according to Sunday's press dispatches, two German ecclesiastics have also fallen under the ban. One is Father Josef Müller, a leader of the Catholic Reform Party in Bavaria, and editor of *Renaissance;* and the other is Prof. Johann H. Schrörs of Bonn University. The first has been directed by the Archbishop of Munich to leave the diocese; and the second, by order of the Cardinal Archbishop of Cologne, finds himself without Roman Catholic students. For some time Professor Schrörs, who fills one of the chairs of Catholic theology, has been lecturing in favor of applying scientific methods not only to Biblical criticism, but also to the interpretation of the Fathers of the Church. Suddenly Cardinal Fischer of Cologne issued instructions to all Catholic students at Bonn University to absent themselves from Professor Schrörs's lectures. The faculty of the university is reported to be indignant at what is regarded as outside interference with the freedom of scientific research, and has petitioned the Minister of Education to protect Professor Schrörs against the Cardinal. In the twentieth century this news falls very strangely on our ears. For comment on it we need do nothing more than quote a sentence from George Haven Putnam's lately published "Censorship of the Church of Rome":

> There is something almost pathetic in the long series of attempts made by popes, councils, bishops, congregations, and inquisitors, to protect the souls of the faithful against the baneful influence of the ever-increasing tide of literature that was pouring forth from the various centres, so much of which was calculated to lead men astray from the true doctrines, and to bring them into risk of everlasting perdition.

We catch the first effect of the Kaiser's visit in the softened tone assumed by the German press, and in the rumor of negotiations under way between Edward VII. and the Emperor, which, because they deal with the affairs of other countries than their own, would presuppose that their own affairs have been satisfactorily adjusted. Edward VII., it has been reported, is striving to bring about a meeting between the Kaiser and the French President. What such an event would mean to the peace of Europe need not be dwelt upon. The probability of such a happening, which five years ago would have been deemed utterly impossible, is due to the momentous series of diplomatic arrangements, which began with the Anglo-French understanding of April 8, 1904. This arrangement, which from the beginning virtually included Spain in its terms, was followed by a distinct improvement in the tone of Franco-Italian relations; France in turn facilitated the conclusion of the recent agreement between Great Britain and Russia; the winning over of Germany's ally, Italy, and Germany's friend, Russia—in other words, the rapid closing of that circle which evoked such ominous growls from Germany—made it incumbent for the Kaiser to make friends with Great Britain, which German opinion, in part, at least, has regarded as the architect of anti-German machinations. And now Edward VII. is preparing to complete his circle of European agreements—a circle not around Germany, but including her as a link—by bringing together Germany and France. We have called such an arrangement not improbable. On the part of Germany, the desire to come to an understanding has existed for some time. There are two favorable factors. First is the situation in Morocco, where France seems pledged to a course of radical action extending over a long period, but where Germany's good or ill-will can make her task comparatively light or extremely difficult. Second is the spirit of mistrust in her powers of self-defence which has fallen upon France of late. The effect of the anti-militarist agitation cannot be minimized. High officials in the army, including one commander-in-chief, have resigned because they would not accept the responsibility of conducting a successful campaign under prevalent conditions. The Chamber has found it necessary to debate the subject "Are We Defended?" The naval arsenals and dockyards are hotbeds of labor sedition, and the frequency with which officers have been arrested for selling information to foreign Powers is alarming. Under such conditions France should welcome the prospect of some sort of understanding with Germany.

The first subject to receive the attention of the third Duma will probably be the agrarian problem. A solution is to be attempted on the lines already laid down by a series of imperial edicts during the last two years. There is to be no wholesale expropriation of landowners, but the transfer of land to peasant cultivators is to be facilitated by means of agricultural banks. Emigration to Asia is to be fostered. Above all, however, the government is to pursue its policy of breaking up the present communal system of peasant proprietorship, and furthering the creation of a class of prosperous peasant landowners. The main object, therefore, of the government's programme is not social, but political. Its experience with the two former Dumas has shown how susceptible the present exceptional status of the peasants renders them to the influence of revolutionary theory and propaganda. The revolutionaries have been saying to the peasants, "You practically are living now under a local socialist régime; all you must do is to get rid of the iniquitous bureaucracy and autocracy to arrive at ideal conditions." The government's hope is to cut the ground from under this argument by eliminating the communistic elements from Russia's rural system. Already, by the Imperial decrees before mentioned, the peasants have been liberated from a number of their political disabilities, the right of free migration has been conferred on them, and the individual acquisition of land has been especially encouraged. Whether the Russian government, after creating a middle class of small peasant proprietors, will find them more easy to deal with than the existing peasant community is, however, an open question. The break-up of the Russian communal system and the building up of a class of large peasant landowners would mean a corresponding reduction of the great mass of the peasantry to the position of propertyless agricultural laborers—a class which might easily make trouble. And there are other difficulties in the way of the government. Among its very supporters in the present Duma, among the members of the Right and the Centre, the Slavophil element is said to be strong. The new president of the Duma, Khomyakoff, is described as an ardent Slavophil. Now, it is one of the main tenets of the Slavophil creed that, in her present system of communal peasant owners, and her consequent lack of a landless class, Russia possesses an enormous advantage over the Occident which is destined to make her the leading world-power in the future. It is a question whether their possible interests as landlords can make the Duma conservatives forget their Slavophil tendencies.

TREASURY'S RELIEF MEASURES.

With full realization of the gravity of the crisis which has inspired the action of the Treasury, we are still of opinion that the course adopted over Sunday is a serious mistake. That it will help the markets for the moment, and hasten through indirect means the restoration of bank reserves, is highly probable. But a precisely similar argument could have been invoked for the issue of $100,000,000 in irredeemable legal tender notes, supposing that recourse to have fallen within the power of the Administration; and to dismiss the action of the government with the easy assertion that the end justifies the means is to surrender all right to judge of the country's financial policy in the longer future. A $50,000,000 issue of Panama Canal bonds, already authorized by law and available as a legal basis for new banknote issues, was doubtless open to objection as a drain on capital when no capital could be spared; but otherwise much might be said in favor of it.

The expedient of short-term notes, on the other hand, we regard as vicious. As a precedent, it is fraught with evil. The extent to which it commits the Treasury for the future to the paternalism which reached such excesses under Secretary Shaw is perhaps the least of possible unhappy consequences, yet this of itself is unfortunate enough. The use of government credit by President Cleveland and Secretary Carlisle after the panic of 1893 bears no analogy to the present case. In that famous instance, the government sold bonds to make good the depleted gold reserve against its own outstanding notes and to enable the Treasury to maintain the public faith. No trouble of that sort exists to-day. Nor does this new operation stand on a footing even with Secretary Cortelyou's use of the public surplus to relieve the recent panic through deposits with the banks. The Treasury then did nothing more than throw back on the money market what in a normal system of finance ought never to have been taken from it. No similar principle can be invoked in behalf of the present action.

It has, we are all aware, the defence of an urgent crisis. Money has been hoarded in stupendous quantities; bank reserves have been heavily cut down; and credit has been paralyzed. Taking into full account these formidable difficulties, we nevertheless cannot blink the fact that the issue of credit notes on the present plan and scale is undeniable inflation. To all intents and purposes, the expedient is like that which an excited Congress voted under closely parallel conditions after the panic of 1873, and which Grant blocked by his courageous veto. In the one case as in the other the government has created a heavy floating debt to raise money which it does not need, and which it proposes to throw into the country's circulation. We do not see how any one can for a moment contend that this is a safe precedent.

People may ask whether the existing emergency was not grave enough to warrant recourse to any shift, however objectionable at an ordinary time, which would avert overwhelming disaster. Our answer is, that the situation did not call for such methods of relief. We believe that the financial strain, severe though it still remained last Saturday, was showing distinct signs of relaxation. The successive steps of this 1907 panic had followed exactly those noted when confidence returned after the crisis of 1893. Then, as now, actual currency was hoarded by the tens of millions; then, as now, a heavy deficit in bank reserves existed; the channels of daily settlement between banks were choked with Clearing House certificates; "pay-roll money" in many cases could not be provided; a premium in the form of checks was bid and paid for currency; the hoarding of cash was thereby temporarily increased; at various inland cities "clearing-house checks" and employers' credit notes were in hand-to-hand circulation. Then, as now, we indulged in a "raid" on London's gold; forty millions were taken for New York, mostly from the banks of England and mostly through payment of a premium. There was not, in short, one phenomenon of the present panic which did not appear in the same order fourteen years ago. Yet the outcome, in 1893, was that, as soon as the New York bank statement indicated that an inflow of foreign gold had stopped the depletion of cash reserves, the currency premium declined, the hoarding ceased, and the hidden money began pouring back into the banks. That stage of recovery had, we believe, been reached with the publication of the bank statement of last Saturday.

If any real difference can be discovered between conditions in 1893 and those of to-day, so far as concerns the international position, it is such as to indicate far greater elements of strength and recuperative power in 1907. During a fortnight past, we have been buying gold abroad as we might have bought pork or iron—by bidding until we found a seller, and by pledging our credit for the payment. But with the subsequent arrival at the seaboard of the enormous quantities of grain and cotton bought by European merchants in our first collapse of credit, we are rapidly paying for the gold in real commodities. Our power to do this has been immensely greater than in the agricultural depression of 1893, and we have far more left in reserve than we had then for further payments. The inference should be plain that the problem of the markets was as sure of solution in the normal course of affairs this year as in 1893. That use of the government's credit will go far towards rectifying the situation without further inroads upon Europe's stock of gold, is entirely probable. The question still remains, however, whether we are not paying too dearly for this result—gratifying as it may be for the moment.

THE WAR ON THE SALOON.

So absorbed has this country been for the last few years in the attempt to regulate corporations, check monopolies, and deal with the unprincipled rich, that a veritable revolution in the sentiment of the people upon a great social question has taken place practically unnoticed. Only when the Georgia Legislature voted almost unanimously for prohibition did the general public begin to learn that there is a great anti-saloon movement under way. It is, however, by no means confined to the South, as the last election has clearly shown. The dispatches report that 160 out of 180 Chicago precincts voted against license at the last election, thus closing 199 saloons. The Chicago City Council voted last week to establish prohibition in a southwestern section nearly a square mile in extent. More than one-half of that city will thus have abolished the saloon. Here in our own neighborhood, White Plains and other Westchester County towns "went dry." In New Jersey, Judge Fort's defence of the Bishops' Law contributed largely to his election as Governor.

The movement cannot be explained in the South by racial problems, or in the North by any popular zeal for total abstinence, or by any sudden, emotional, semi-religious outburst against the drink evil. The Southerner does not turn total abstainer merely that the negro may thereby profit physically and spiritually. The Northerners who are going to the polls in such large numbers and silently voting away the "poor man's club" are not all teetotalers. Nor is their action influenced by a narrow belief that men can be made moral by act of legislature, such belief as brought about the prohibition laws in Maine, Vermont, New Hampshire, and other States half a century ago. The strength of this movement lies in the votes of localities. When the prohibition laws were repealed in New Hampshire and Vermont, many towns and cities voted for license. Gradually these are swinging back into the prohibition column, just as in North Carolina 62 out of 97 counties are "dry," and all but thirty towns and cities, as a result of local initiative and decision.

Naturally, the liquor-dealers are everywhere in great alarm, and are seeking to counteract the movement by supporting extreme anti-saloon measures. Conditions in Alabama show how little likelihood they have of succeeding. In spite of concessions on the part of the li-

quor interests, the Prohibitionists, by means of the local-option law, have driven them out of county after county. Three counties were carried at the end of October by such large anti-saloon majorities that it is evident that six others in which elections are pending will go the same way. Already 41 out of 67 Alabama counties are "dry." Naturally, the Legislature will not long stand out against public sentiment of this kind, and a State prohibition law may be looked for within the near future. Mississippi will adopt prohibition just as soon as its Legislature assembles in January—this even the liquor-sellers admit. Tennessee is practically lost to them, for only three towns and three cities and 5 out of 96 counties still tolerate the sale of liquor; in Kentucky, the recent anti-saloon victory speaks for itself. Indeed, if Mr. Roosevelt had stopped to analyze the Republican victory in that State, for which he officially expressed his gratitude, he would have found that it was not a Republican, but a temperance triumph. Louisville itself did a noble day's work in defeating the political corruptionists, and in closing the shops of their chief supporters, the rum-sellers. Altogether, in the South the liquor-sellers have been driven out of 981 counties, and are allowed to operate only in 275—and the latter figure decreases week by week. Even in Louisiana, where an effort has been made to control by high license, rather than by prohibition, there are indications that the nineteen dry parishes will soon be reinforced by some of the forty which now permit the sale of liquor.

That the West is in sympathy with the movement appears from the inclusion within the Oklahoma Constitution of a prohibition clause. In Illinois, so the Chicago *Evening Post* reports:

> Victories too many to enumerate were won by the anti-saloon forces; and not in the "country" alone, but in towns and cities of size and importance. Jacksonville went "dry" by a majority of nearly 800 votes, and it is only here and there that the saloons escaped the rising flood.

The *Post* adds that prohibition as an election issue is now out of the Prohibition party's hands, and has become the "popular cause of many thousands of voters" who are still Republicans and Democrats. It attributes this change largely to the new methods of the anti-saloon leagues. They appeal to reason rather than to emotion, and make use of modern advertising methods to bring home salient facts, and are getting greater and greater support from business men of means and standing. Thus in Indianapolis the Kokomo Steel and Iron Company estimates that the saloons near its plant cost it $75,000 a year. It asks for a law prohibiting saloons in factory districts. "Kokomo," it says, "has thirty saloons that pay $7,500 a year into the city treasury. The manufacturing interests are damaged more than ten times that amount by the saloons."

Will it last? Can the laws be enforced? Is the vicious Maine experience to be repeated? These are the questions every one must ask who ponders on this extraordinary reversal of public sentiment, which, as *Bonfort's Wine and Spirit Circular* puts it, makes the liquor-dealer confront the practical question whether he is not to be wholly legislated out of business. Any liquor law can be enforced behind which there is public opinion, and at present the feeling against the saloon is so spontaneous, is such a natural rising of the people, that there is greater hope for the success of prohibition than ever before. "Blind tigers" there will be, of course, and officials who will connive at an illegitimate traffic. But in Birmingham, Ala., to cite one case, since Mayor Ward has come into office, prohibition in that city does prohibit, and the anti-saloon leagues have learned to stand by him and other executives with their "law-enforcement departments." What the situation in the rural districts of the South, where practically every farmer can brew some kind of intoxicating drink for himself, will be five years hence, no man can foretell. But the prospects are excellent for a rigorous restriction of a business that is the costliest, the most demoralizing, and most injurious of any the State permits.

OMNISCIENT RULERS AND KITCHEN-CABINETS.

Not the least interesting feature of the revelations made in the Harden trial is their light on the essential limitations of the human mind, even when that mind belongs to the head of a great nation. William II.'s amazing versatility has been the subject of more eulogistic comment than has fallen to the lot of any of his contemporaries, with one exception. The War Lord of Europe has repeatedly laid aside his helmet and his sword to strike the poet's lyre, or grasp the wheel of his racing yacht, or to join debate with theologians and Assyriologists, and always with heaven-stirring success. What was there this strenuous young man did not know thoroughly, or could not do with unrivalled perfection? Great historical painters engaged in depicting the fortunes of Germany and the Hohenzollerns were dumfounded by the Kaiser's acquaintance with the minutiæ of early European history. Leoncavallo, after composing the music for "Roland of Berlin," declared that if the Imperial librettist were not the first monarch of the Continent, he could easily be Europe's greatest tone-poet. Grizzled generals, accompanying the Kaiser on manœuvres, can only quail before the eye that grasps at the same time the nature of an entire terrain and the wrong shade of the buttons on a corporal's uniform. American millionaires declare him the prince of good fellows, and informed on everything connected with this country. And so on without end. The only pity is that William II. does not seem fully acquainted with his duties and responsibilities as Emperor of Germany.

"The Emperor knows only what I wish him to know," declared Prince Eulenburg, head of the court clique which is shown to have exercised a profound influence on the course of German politics from a date preceding the fall of Bismarck in 1890. The way of the Great Chancellor was made hard by the camarilla; it brought about the overthrow of his successor, Von Caprivi, and the appointment of Hohenlohe and the present Chancellor von Bülow. When Bülow, then Ambassador at Rome, attempted to put aside the honor Prince Eulenburg would thrust upon him, and urged the Prince to take the post himself, the latter replied: "I will make kings, but I will not be a king." And the German Emperor has the mortification of reflecting that this modern Warwick did not even bestow the royal title on William II. in person, but on his first minister, thus reducing his sovereign to the position of an instrument. The successive Chancellors, in fact, refused to be tools of Prince Eulenburg, and as a result, Germany, in her foreign relations particularly, was often led to pursue a double policy—the official policy of the Chancellor and the foreign department, and the personal policy of the Emperor, acting under the inspiration of the camarilla. The Morocco crisis of 1905, with its imminent threat of a general European war, was brought about, according to Maximilian Harden, through wrong information with regard to French opinion obtained by the Emperor through Prince Eulenburg.

If the Kaiser was exposed to the dangers of wrong counsel in matters of broad foreign policy, what chance was there of his receiving correct information with regard to the internal affairs of his Empire? The Agrarian camarilla had even more to gain by shutting off the Emperor from his subjects than from his Chancellor. There are not wanting in Europe apologists for the autocratic system who are accustomed to sneer at parliamentary government as a composite of parochial politics, log-rolling, and electioneering tactics. The implication is that an autocrat, swayed neither by local prejudice nor personal ambitions, is the ideal guardian of national interests. There are Germans who, though favoring the establishment of a thorough Constitutional régime, with a Ministry responsible to the Reichstag, believe that with regard to the army and the navy Imperial exigencies demand the concentration of power

in the hands of the Emperor. But it appears now that the very security of the Empire, for the sake of which the people are ready to carry almost unparalleled burdens, suffers from the inevitable vices of autocratic control. Would the safety of the Empire be threatened by interpellations addressed to a responsible minister of war in the Reichstag, as it has been threatened by hideous revelations concerning the morals of part of the army's officers and rank and file?

Excessively self-confident by nature, and carried away by the flattery of his courtiers and of the world, the Kaiser may have forgotten that one cannot do everything and do everything well. It is no imputation against the loftiness of his motives—the absolutist tradition, which is so strong in Germany—that, forgetting the primal functions of his office as chief magistrate of a great nation, he has tried to be all things to all men. Men, at bottom, are still imperfectly democratic, and their response to the influence of a Great Example may be so powerful at times as to prove a personal distraction, and a positive hindrance to the maintenance of a just view or of correct proportions. The Kaiser's advocacy of a certain book, or his condemnation of a certain school of scientists, or his curt disposal of the woman question as one of *Kinder und Küche*, or his exaltation of righteousness above peace, may be welcomed with such thunders of popular applause as to make him temporarily forget that, with Emperors as with shoemakers, sticking to the last is the best policy in the end.

PROFESSOR NORTON AT EIGHTY.

The commemoration last Saturday of the eightieth birthday of Charles Eliot Norton has not only given his friends and former pupils an opportunity for expressing personal gratitude and affection, but has furnished occasion for surveying a career which has been unique in American life. No critic has made so deep an impression as Mr. Norton on some of the best minds of his time. We might perhaps define his life-work by saying that he has demonstrated the function of culture and the efficacy of criticism, conceived broadly, in a modern democracy.

In his early years, Europe, and especially Italy, revealed to him the immense part beauty has had, and ought to have, in the development of the highest qualities in individuals and in races. He absorbed Ruskin's enthusiasms, without surrendering his own judgment, and arrived, by a patient and systematic study of the fine arts, at rational conclusions concerning the degree to which a civilization can be measured by its architecture, sculpture, and painting. But he was forty-eight years of age before being called to the Harvard professorship, from which, during twenty-three years, he addressed a multitude of students. At first, few of them, and fewer still of the public outside, understood him. It is almost ludicrous now, when nearly every important American city has its art museum or its art schools, to recall that Mr. Norton was long as one speaking in the wilderness. He made his professorship a fountain of the humanities. For he was not only a master in his specialty, but also a cultivated man—a combination which modern erudition almost precludes. Younger men went to him for advice on books, or conduct, or politics, or religion, because they found that his lectures were saturated with human interest, and that the lecturer himself was the most hospitable of scholars. Harvard, in transition from college to university, was particularly forturate to have in its faculty such an exemplar of culture. Whether his counsel were followed or not, it never passed unheeded. He spoke as the enlightened critic; as one whose standard was not local, whose experience of men and books was wide, and whose aptitudes and discipline lay in the field where the highest type of men is developed.

The service of a critic like Mr. Norton, especially in our time and country, cannot be over-estimated. Assuming that, because the United States is a great experiment, it cannot be helped by the past, people repeat blunders which a knowledge of the past would teach them to avoid. It is the function of criticism to publish this knowledge. Public men resent such interference; and there was no better proof that Mr. Norton's criticism cut deep than the scorn which some of them pretended to feel for the "mere critic," the "common scold," the "Pharisee," the man who would not "come down into the heat and dust of the arena," but who sat aloof and belittled the efforts of the patriotic gladiators. The language of such as they has not changed since the first demagogue misled the first popular assembly. Much of the effectiveness of Mr. Norton's criticism was due to the fact that he spoke for the conscience of that remnant which is hated by its own generation and haloed by the next. The courage required to stand out against popular frenzy, to utter truths which will alienate one's associates, is rare. Yet it has been so natural to Mr. Norton that he probably has never thought of it as a virtue in his case. Unless a nation wishes to sink to a level of self-conceit and swagger which doom it to decay, it will learn that he is the true patriot who sets before it the highest standards. Such patriotic service Mr. Norton has rendered his countrymen for half a century.

One of the delusions of the age is to regard men of action as superior to men of ideas. Yet in the promulgation of ideas, a critic may have the force of an originator, by giving to ideas the suppleness or charm they need in order to pass current. It we had a record of Mr. Norton's suggestions to editors, publicists, and speakers, we should be able to measure, in part, at least, the extent of his influence in putting ideas in circulation. The "Life" of Mr. Godkin revealed not only that Mr. Norton was one of the founders of the *Nation*, but that he was a counsellor to whom its editor turned in any emergency for criticism and support. Nearly ten years before the *Nation's* birth, Mr. Norton had fostered the project which resulted in the *Atlantic Monthly*. For six years he himself edited the *North American Review*, and during the Civil war, as secretary of the Loyal Publication Society, he compiled its broadsides, which carried to all parts of the country the principles which saved the Union.

All these activities, which now seem mere by-products in Mr. Norton's career, were little known by the larger public. They represent, however, a vital part of his character. He would hold that that culture is spurious or sickly which does not teach one to be a citizen. In his own Cambridge he joined as naturally in the movement to promote temperance as in support of the hospital for incurables, or in the plans for beautifying the city. And from Abolition days to the present, no one who cared to know was left in doubt as to where Mr. Norton stood on the great issues before the State and the nation. Critical as he has been of American shortcomings, he has never been other than an American. The very close ties which have bound him to England have made no Anglomaniac of him.

But every consideration of Mr. Norton's detailed activity leads back to the personality of the man himself. What is the secret of his charm, the key to his power? On the moral side, he has had conscience and courage; on the critical side, taste; on the human side, sympathy. To a far greater degree than Edward FitzGerald, Mr. Norton has had taste—which that quaint genius defined as "the feminine of genius"—for he has had catholicity. He has not only gone straight to the acknowledged masters of world-books, but has been quick to discern the promising new-comers. Many an author who has since achieved distinction can recall that his first recognition came from Shady Hill.

Such recognition springs from hospitality of spirit not less than from taste; and Mr. Norton has been the companion of the *élite* of two generations. Thanks to these, he has mingled as freely with his elders—with Emerson, Longfellow, Carlyle, FitzGerald, as with his nearer contemporaries—Lowell, Stephen, and Ruskin, Godkin and Curtis—as with his juniors, from Mr. Howells and Mr. Bryce and Mr. James, down to the young un-

dergraduate of to-day. What his friendship meant can be read in the tragic letters of John Ruskin, whom he steadied in great moral crises and whose genius he guided to produce some of its most precious work. In the Letters of Leslie Stephen you find that it is again the friend at Shady Hill to whom the most intimate messages are written, and from whom come suggestions and advice. How loyal and tender and discreet that friendship has been appears also in the editing of the correspondence of Carlyle and Emerson, of Lowell, and Ruskin, and Curtis. One might almost imagine that Mr. Norton has been too solicitous of the fame of his illustrious contemporaries to take any thought for his own.

Of his own books the prose translations of Dante may almost be regarded as original works. His early "Notes of Travel and Study in Italy," issued nearly half a century ago, are still delightful for general reading and valuable as picturing the Italy of the fifties. In his "Church-Building in the Middle Ages" Mr. Norton has embodied many of his ideas on the philosophy of art, besides giving the most interesting and exhaustive account in English of the way in which three of the great monuments of mediæval architecture were planned and carried out.

The final achievement of such a career can never be summed up, because its influence penetrates quietly and deep. Nobody can point to a group of men and women to-day and say, "There are Mr. Norton's disciples"; for the very essence of his influence has been to instil into each one according to his needs and capacities principles which are no man's monopoly, but may be every man's treasure. To America, his example has been precious. It has dignified the scholar's calling by showing how the scholar also may have wide human interests; it has ennobled the profession of teaching, by proving that the professor may have culture, which is more than erudition; it has strengthened the earnest thinkers, the lovers of beauty, the men of conscience, who have been baffled or disheartened by the barbaric tendencies of a plutocratic age. Mr. Norton, shunning publicity and unknown by the million, has shed his influence on the hundreds and the thousands, and they in their turn have reached the multitudes. To do this, and in doing it to win the respect and affection of the best of two generations, is better than fame; it is self-realization through the most fruitful and unselfish service.

THE NEW STYLE OF ORATORY.

Arthur J. Balfour recently made an address to the students of Edinburgh University on the art of public speaking. It is always instructive to get such comments of a practised speaker on his own craft. They ought to be peculiarly useful to students who have possibly a surfeit of abstract teaching in rhetoric and oratory, and who might well find it refreshing to encounter the real thing, and supplement a professor by a practitioner. Mr. Balfour had many sensible things to say. The sum of his doctrine was that the art of public speaking is simply the art of public conversation raised to a higher level. This, of course, is merely another way of valuing the qualities of simplicity, directness, and vivacity above a stilted and fustian-loaded style.

A change in the direction favored by Mr. Balfour has undoubtedly come over public speaking within two generations. The taste of the best speakers as of the most intelligent audiences is all away from ranting and the pompous style. We doubt if Webster's famous peroration, "When mine eyes shall be turned," could be delivered in the Senate to-day without provoking a titter. It was in good and approved form in his day, as was the same orator's elaborate and metaphorical way of asking that the question before the Senate be read; but we unleisured moderns demand that a speaker go more swiftly to the point, and with fewer oratorical furbelows to impair his speed. And if he can give us, instead of high-flying eloquence, a sort of sublimated conversation, Mr. Balfour is unquestionably right in saying that he will please us better.

It must not be forgotten, however, that there is conversation and conversation. Some unhappy men orate when they converse. There was the well-known complaint of the Queen that Mr. Gladstone addressed her in private as if she were a public meeting. One of the perils of an inflated public style is that it may be carried into private life. When Roscoe Conkling went to Ohio in the Garfield campaign of 1880, he was invited to meet three or four influential men in a Cleveland house. They expected a rational conference, but Conkling stood with his back to the chimney and harangued them for a mortal hour. They could not have been more bethumped with words if they had been a national convention. That was clearly a case where the conversational method did not work. The reverse of that failure is seen where a man who is dull or sleepy in private conversation, insists upon being so also in public discourse. H. W. Lucy, in an article on "Speech-Making in Parliament," recalls a story about the Duke of Devonshire, when he was Lord Hartington, which illustrates the hazards of the conversational style when it is *not* raised to a higher level.

Taking a lady down to dinner on an evening when earlier he had made an important speech in the House of Commons, she asked whether it was true that at one stage of his argument he had interrupted himself with a prolonged yawn. He admitted the indictment. "How could you?" said the lady. "Ah," said Lord Hartington, "you don't know how dull the speech was."

Speaking to a university audience, Mr. Balfour would have been ungracious if he had done despite to the theoretical teaching of oratory. He did not; rather, he praised and urged it. Elocution, he thought, should be thoroughly studied. He warned his young hearers, however, to distinguish between the art of elocution and the arts, or artfulness, of elocutionists. By this he meant the inculcated tricks of gesture, advice about raising or lowering the voice to show emotion—all of them, affirmed Mr. Balfour, "things which are taught by professors of elocution, but which are not practised by any successful speakers." This, too, is in line with the prevailing demand for simplicity in oratory. We suspect a man who tears himself to tatters; he is all too probably following the advice of Lyman Beecher that, when you had nothing to say, you were to "holler." Lyman Beecher's greater son sometimes hollered, no doubt, but at the height of his fame and genius, Henry Ward Beecher gave as fine an example as one could wish of public speaking which was essentially conversation aglow and transfigured.

After all, one can never get away, in all such discussions, from the mystery of personality. It is that which makes the orator. All you can say is that some men have the magic power of casting a spell over an audience. Their speeches may not read well in print, being bad, often, both in form and in logic. Fox's speeches were usually of that sort, yet those who heard them delivered were under what a contemporary called "the wand of the magician." It is in the temperament, the character, the fused mind and soul of the speaker that the incommunicable secret of the great orator lies. It was in this respect that Mr. Balfour placed Gladstone "far above" any other speaker to whom he had ever listened. "Mr. Gladstone," he said, "held his hearers spellbound, not only by his words, but by the character of his gestures, the tone of his voice, the flash of his eye."

SIR LEWIS MORRIS.

Sir Lewis Morris died on November 12. He was born in Carmarthen, Wales, in 1833, and was graduated from Jesus College, Oxford, in 1855. In 1861 he was called to the bar at Lincoln's Inn, where he practised—chiefly as a conveyancing counsel—until 1881. Meanwhile his interest in education and literature was bringing him into prominence in fields outside the bar. He was made an honorary fellow of Jesus College in 1877, and not long after he became honorary secretary of the University College of Aberystwith, of which he was later successively treasurer and vice-president. In 1880 he was made a member of the committee to inquire into the subject of inter-

mediate and higher education in Wales; and he wrote numerous addresses and papers on educational subjects. Among the early advocates of the University of Wales he was a leader, and he became deputy chancellor of the institution, and was on the governing boards of the three Welsh colleges. He also served as justice of the peace for Carmarthenshire, his own county. In politics he was an active Liberal and ran, although unsuccessfully, for Parliament. In 1895 he was knighted. He was best known as a writer of verse. His "Songs of Two Worlds," 1872-1875, and "The Epic of Hades," 1876, have run through many editions. His other volumes are: "Gwen: a Drama in Monologue," 1879; "The Ode of Life," 1880; "Songs Unsung," 1883; "Gycia," a drama, 1886; "Songs of Britain,"—embodying several beautiful Welsh legends—1887; "A Vision of Saints," 1890; "Songs Without Notes," 1894; "Idylls and Lyrics," 1896; and "Harvest Tide," in 1901. He wrote on request (the laureate was ill) an ode for the foundation of the Imperial Institute, and for it he received from Queen Victoria the Jubilee Medal. He also wrote odes on the Queen's Jubilee, on the death of the Duke of Clarence, and on the marriage of the Duke and Duchess of York.

As an author Sir Lewis Morris was overshadowed. His very name blanketed him. William Morris, born only a year later, was far better known as a writer of both verse and prose and as leader of a movement in art. The result was that Sir Lewis, who by any other surname would have stood fairly on his own merits, was often dismissed as "the other Morris." And the sting of this sneer lay in the fact that in too many respects he was only the other Morris. His figure was not individual and striking enough to be stamped sharply on the popular consciousness. Tennyson, Mr. and Mrs Browning, Matthew Arnold, William Morris, and Swinburne—these are names that convey a fairly clear idea to every one familiar with the poetry of the nineteenth century. Rossetti is less widely known, and James Thomson has but a small band of admirers; but no one carries away from "The Blessed Damozel" and "Jenny" or "The City of Dreadful Night" a blurred image of the authors. Nor can any one who reads a considerable amount of Sir Lewis Morris's poetry say that he is dim or wavering in outline; yet he has written no single short piece which is as distinct and unforgettable as any of the three which we have just mentioned; and each of his works seems not quite so good as something else of the same type.

Of his shorter poems, the "Ode on a Fair Spring Morning" is perhaps the best and most characteristic. It has been compared to Milton's "L'Allegro" and "Il Penseroso," but that is too severe a test. Milton's two poems are of the kind that you memorize almost as you read them; you rise from the perusal with certain lines running in your mind like bars of music:

> To hear the lark begin his flight,
> And singing, startle the dull night,
> From his watch-tower in the skies
> Till the dappled dawn doth rise; . . .
> Russet lawns and fallows gray,
> Where the nibbling flocks do stray;
> Mountains on whose barren breast
> The laboring clouds do often rest;
> Meadows trim, with daisies pied,
> Shallow brooks and rivers wide.

But there is no such magic in Morris's verse:

> Oh, see how glorious show,
> On this fair morn in May, the clear-cut hills,
> The dewy lawns, the hawthorns white,
> Argent on plains of gold the growing light,
> Pure as when first on the young earth
> The faint warm sunlight came to birth.
> There is a nameless air
> Of sweet renewal over all, which fills
> The earth and sky with life, and everywhere,
> Before the scarce seen sun begins to glow,
> The birds awake which slumbered all night long,
> And with a gush of song.
> First doubting of their strain, then full and wide
> Raise their fresh hymns thro' all the country side;
> Already, above the dewy clover,
> The soaring lark begins to hover
> Over his mate's low nest.

And one more passage from the close of this poem:

> We too again shall rise,
> The same and not the same,
> As daily rise upon the orient skies
> New dawns with wheels of flame.
> So if it worthy prove,
> Our being, self-perfected, shall upward move
> To higher essence, and still higher grown;
> Not sweeping idle harps before a throne,
> Nor spending praise where is no need of praise;
> But through unnumbered lives and ages come,
> Of pure laborious days,
> To an eternal home,
> Where spring is not, nor birth, nor any dawn,
> But life's full noontide never is withdrawn.

As the first quotation from Morris echoed Milton this echoes Wordsworth's "Ode on the Intimations of Immortality." These parallels are more illuminating than a column of exposition and argument. They make it clear that Lewis Morris's poetry is simple, sincere, and full of charm, is smooth and competent in workmanship, but is lacking in originality and strength.

He tried his hand at classical subjects, but he produced nothing to match Swinburne's experiments, nothing that approaches, say, the lyrics of "Atlanta in Calydon." In the "Epic of Hades" Morris takes us through Tartarus and Hades, and finally to Olympus, and there lets Tantalus, Sisyphus, Clytæmnestra, Helen, Artemis, Zeus, and many others tell us their stories. The versification is fluent and skilful, but it leaves us unmoved. The account of the contest between Marsyas and Apollo—put into the mouth of Marsyas—has been as much praised as anything in the book. It is, of course, an apologue, and, by a strange pathos, an apologue in which Morris himself is Marsyas—

> He [Apollo] Swiftly struck his golden lyre,
> And played the Song of Life: and, lo, I knew
> My strain, how earthy! . . .
> . . I do not blame
> Phœbus or Nature which has set this bar
> Betwixt success and failure, for I know
> How far high failure overleaps the bound
> Of low successes.

"EXPERTISM" AT OXFORD AND LORD CURZON'S LECTURE ON FRONTIERS.

OXFORD, November 3.

Three things have just happened showing the drift of tendencies in the University and the community of Oxford, towards "expertism"—to use one of Dr. Bradley's *nonce-words*—and reinforcing the tribute paid to that form of efficiency by the election six months ago of a chancellor fresh from six years of service in India. There Lord Curzon was chancellor of the University of Calcutta, and he had, as Viceroy, appointed a Universities Commission, and promulgated (1904) a new Universities act based upon that commission's report (1902). On October 24 Congregation voted by a majority of 132 the establishment of a professorship of engineering, called for along with other endowments in Lord Curzon's recent appeal on behalf of the University for £250,000. On November 1 the burgesses of the city of Oxford made a similar move toward enlightened efficiency in municipal concerns. A daughter of that distinguished historian, the late Dean of Ely, Miss Merivale—an expert in matters of hygiene, housing of the poor and allotments for the working classes—was elected Town Councillor at the head of her poll. Unlike the defeated lady candidates at Newbury, Liverpool, and Bolton, Miss Merivale did not stand as a Liberal, but was supported by all parties alike. And so the city of Oxford shares with Reading, where Miss Sutton was elected, Aldenburgh, where the eminent physician, Mrs. Garrett Anderson, came in, and Bewdley, where Mrs. Woodward was unopposed, the distinction of having secured an expert administrator on the first opportunity afforded by law for the election of a woman-councillor.

The third significant happening is the chancellor's Romanes lecture* given yesterday. The theme was "Frontiers," about which the chancellor could speak as scientific expert, since he had been called upon as Viceroy "to organize, and to conduct the proceedings of as many as five Boundary Commissions." His lecture, from which these words are taken, thus resembled, in its choice of subject, the preceding ones of Weissmann (1894, on "External Influences and Development), Huxley (1902, "Evolution and Ethics"), and Bryce (1902, "Advanced and Backward Races of Mankind), each of whom also spoke as an expert.

Lord Curzon first dealt with frontiers in history, classifying, not in every case quite convincingly, as frontier wars, nearly all wars involving disputed territory, and then pointed his exordium with "the philosophy of frontiers" as concretely embodied in a passage from Lord Macaulay's "Frederick the Great." Next he spoke briefly of the "origin of frontiers." Reaching then the heart of his subject, he proceeded to discuss "natural" and "artificial" frontiers in what must always be admired as a statesmanlike, a scientific, and a remarkably original presentation of the whole subject. The breadth of his survey and the freshness of his generalizations gathered persuasion from his seemingly inexhaustible arsenal of concrete examples. The facts were presented in faultless historical perspective, and the definitions and principles arrived at came with all the interest and conviction attaching to that which every one felt he would have said himself had he had but the wit or the luck to think about the matter at all.

(1) The sea, (2) the great deserts, (3) great mountain ranges, (4) rivers, (5) wilderness of forest, marsh, and swamp, such were his categories of "natural frontiers"; the second, and the fifth, he said, though once important, were becoming more and more negligible. Then he proved that the fourth had commonly proved a delusive type of frontier—the source of contentions, perplexities, and appeals to arbitration.

* *Frontiers.* By the Right Hon. Lord Curzon of Kedleston. Oxford: The Clarendon Press; New York: Henry Frowde.

Dealing with "artificial" frontiers, he classified these as (1) the palisade, mound, or rampart-wall, such as the Roman walls in Britain and Central Europe, and the Chinese Wall, for each and all of which he made out a strong case of efficiency in their day and generation. Next came (2) the "intermediary" or "neutral" zone, such as that of fifty years ago between Korea and China, or as the mediæval marches under Charlemagne and Otto and the West Saxon kingdom of Mercia. From this type of frontier were evolved, he said, (3) the modern idea of a "deliberately neutralized" territory, state, or zone, and (4) the conception of a "buffer-state," *i. e.*, "the country possessing a national existence of its own, which is fortified by the territorial and political guarantee, either of the two powers between whose dominion it lies and by whom it would otherwise inevitably be crushed, or of a number of powers interested in the preservation of the *status quo*." Here was interjected a brief and not wholly laudatory characterization of the Anglo-Russian Agreement, just published. The Chancellor emphatically condemned the "neutralizing pledge" about Tibet as a "novelty in international diplomacy," and closed his chapter with three common forms of the artificial frontier: (a) the pure astronomical frontier, which recalls the political war cry, "Fifty-four forty or fight"; (b) "frontiers by reference," such as the notorious Alaskan boundary-line; (c) the straight line from point to point, which he condemned as inelastic and tending to irrational results.

There came a chapter on "modern expedients" running through the whole diapason of latter-day diplomacy, from the pianissimo of "spheres of interest" through the piano of "spheres of influence," the mezzoforte of *Hinterland*, and the forte of protectorates, to the fortissimo of "incorporation" and "the grant of leases." These last were granted he said, defining somewhat in the vein of the "Master" of his undergraduate days at Balliol, "in order to veil an occupation not as a rule intended to be temporary." But then he hastened to forestall any imputation of pessimism by declaring that these modern expedients "make on the whole for peace rather than for war," and insisting, as Jowett in his place might well have done, that there has been "a progressive advance both in the principles and in the practice of frontier policy," which has already exercised a "widespread effect" and is of good omen for the future. Here as elsewhere the cogency of the lecturer's array of evidence drove home the justness of his inference. Next came a graphic sketch of the triple Indian frontier, (1) the administrative border, (2) the frontier of active protection, (3) the outer or advance strategical frontier, *i. e.*, the Afghan border. This is the most highly organized frontier system in the world, comparable to its "ancient counterpart and prototype, the frontier system of Rome."

Finally the chancellor invited his hearers to expatiate with him for a last moment in that fairyland of facts, the realm of frontier romance, by contemplating "types of manhood thrown up by frontier life," as exemplified in the history of the Anglo-Saxon race. Not till the American pioneers began to push across the trackless plains did America, he said, "cease to be English and become American." The American nation was born "in the forests on the trails of the frontier, amid the savagery of conflict, the labor of reclamation and the ardors of the chase." Such was the cradle of "that wonderful virile democracy, imbued with the courage and tenacity of its forefathers, but fired with an eager and passionate exaltation." To the trapper and fur-trader, the hackwoodsman succeeded; close on his heels trod "the rancher with his livestock, the miner with his pick," the farmer, and finally the urban dweller, the manufacturer and the artisan. "On the top of the advancing wave," he added, "floats a scum of rascality that is ultimately deposited in the mining camps of California and the gambling dens of the Pacific Coast." From this tempestuous mass of passion and privation, a new character emerged, "earnest, restless, exuberant, self-confident." Here an Andrew Jackson, there a Lincoln, "flamed across the stage." Into this "noble heritage of achievement and suffering, the whole nation has entered," said he, "purified and united in its search for the frontier."

Turning, then, to the other side of the world, the eternal Himalayan snows, Persian and Arabian wastes of red-hot sand, the swamps and wilds of equatorial Africa, there, too, he found a school of character where "the British Empire may be seen shaping the British character, while the British character is still building the British Empire." And he averred solemnly that there was no school of character, "outside the English universities," to compare with the frontier. There "in the furnace of responsibility and on the anvil of self-reliance" character was moulded. There were to be found "our twentieth century Marcher Lords" of "courage and conciliation, patience and tact, initiative and self-restraint." "More often than the civilian," said he, "the soldier furnishes this type; and it is on the frontier that many of the greatest military reputations have been made." There was a detachment and a notable tone of conviction here from which his audience learned to forget that there ever had been rumors of Lord Curzon's differing in opinion with his military adviser in India. His closing words were equally taken to heart, when he spoke of that "larger atmosphere" on the outskirts of empire, where "the machine is relatively impotent, and the individual is strong," in which our youth find an invigorating stimulus, "saving them alike from the corroding ease and the morbid excitements of Western civilization," and ended by proclaiming the ban of empire to the sons of Oxford: "The empire calls," frontiers continue to beckon; "may this venerable and glorious institution, the nursery of character and the home of loyal deeds, never fail in honoring that august summons."

Such was the memorable lesson read from the academic throne for all members of the university, graduates and undergraduates, as well as for their betters, from Lady Margaret and Somerville Colleges, and elsewhere, to read, mark, and inwardly digest. LOUIS DYER.

THE HILPRECHT CASE.

In the October number of the *American Journal of Semitic Languages and Literature*, under the title "The Hilprecht Case," is published a letter addressed to Prof. H. V. Hilprecht by sixteen of the leading Oriental scholars of the country: Profs. Charles R. Lanman, Crawford H. Toy, George F. Moore, and John Williams White, Harvard; Francis Brown, Union Theological Seminary; Maurice Bloomfield and Paul Haupt, Johns Hopkins; Richard Gottheil and A. V. Williams Jackson, Columbia; Charles C. Torrey, Hans Oertel, and E. Washburn Hopkins, Yale; Robert Francis Harper and James Richard Jewett, University of Chicago; Dr. William Hayes Ward, New York City; and ex-President Daniel C. Gilman of Johns Hopkins. They demand an explanation of the charges of falsification of scientific records made against Professor Hilprecht in connection with his publications on the Nippur expedition, and the correspondence ensuing. In view of this publication, it is proper to summarize the history of this *cause célèbre* in archæology.

Dr. Hilprecht, a German by birth and education, was appointed professor of Assyriology in the University of Pennsylvania in 1886. In 1888 he was attached to the staff of the University of Pennsylvania expedition to Babylonia, as one of two Assyriologists. In 1898 he was made scientific director of the expedition, Dr. John Henry Haynes being at that time field director. Early in 1900, Haynes discovered, at Nippur, while Hilprecht was on his way to join the expedition, a large number of inscribed clay tablets, which Hilprecht at once declared to be the Temple Library. In the next few years Hilprecht issued various publications, several of which received the official imprint of the University of Pennsylvania, in which he described the discovery by *himself* of this alleged library, and gave a description of its contents, illustrated by a number of specimen tablets. Some of the curators of the museum noted that among these specimen tablets were certain objects which, from their museum labels, would appear to have been purchased or discovered at an earlier date. This fact becoming known to some of his former colleagues in the winter of 1904, the attention of the museum authorities was quietly called to the apparent discrepancies, with the suggestion that steps be taken to correct the error. The matter was first brought to the attention of the public by a paper on the Library at Nippur, read by Dr. Hilprecht before the Philosophical Society in Philadelphia in March of 1905, which was at once answered and criticised by some of his colleagues. At the same time a considerable part of the managing board of the museum, with some of the curators, resigned their positions, believing that frauds were being perpetrated, which the authorities would not allow them to investigate and correct. The press of Philadelphia now took up the matter with great energy. New facts came to light, and finally definite charges of falsification of scientific records were laid before the trustees of the University of Pennsylvania, with a request for a full investigation.

By this time the scandal had assumed such magnitude that the trustees appointed a committee of their own number to inves-

tigate the charges. This committee exonerated Dr. Hilprecht, but its report was generally regarded, both by the press and by scholars conversant with the facts, as without weight, a mere white-washing report. For the information of the scholars of the country, who had heard about the matter only through the daily press, a paper was prepared by the Rev. Dr. John P. Peters, one of Professor Hilprecht's former associates at the University of Pennsylvania and in the Babylonian explorations, and laid before the American Oriental Society, consisting of practically all the Oriental scholars in this country and many of those abroad, at its annual meeting in the spring of 1905. This paper set forth, from the evidence then available, that every single object which Professor Hilprecht had published from the library which he asserted he had discovered could be and had been traced, and that all of these objects had either been purchased elsewhere or discovered at other parts of Nippur, at times antedating Hilprecht's alleged discovery from a few months to eleven years; that the detailed accounts which he gave of the discovery of some of these objects were pure fabrications; that at the time of those publications he had not even examined the tablets which he alleged to constitute a library; that said tablets had been found by Haynes and boxed for transport before Hilprecht's arrival, with the exception of some twenty specimens; and that these boxed-up tablets had not been opened and unpacked at the time of publication of the various books and booklets referred to. Other associates and colleagues of Professor Hilprecht in the work of the Babylonian expedition were present to corroborate the facts presented and answer questions; but Hilprecht himself, although a member of the society, was not present and presented no answer. While the statements made with regard to his falsifications seemed to be sustained by the proof presented, yet in view of the sweeping nature of the charges made and the almost incredible stupidity as well as turpitude of such falsifications, not a few of the Orientalists present desired to reserve judgment until such time as Professor Hilprecht should make public answer to the charges.

At the next annual meeting of the society, in the spring of 1906, no answer having appeared, Prof. Morris Jastrow, jr., one of Professor Hilprecht's colleagues at the University of Pennsylvania, presented a second paper on the same subject, bringing forward further and still more conclusive evidence of the fraud perpetrated. At this point the matter was taken up by the Oriental scholars of the country as a body; but in preference to formal action by the society, it was decided that sixteen of the leading scholars there present should address to Professor Hilprecht a letter, asking for an answer to the charges made, which involved "the gravest imputations upon the integrity of American scholarship." In part answer to this letter, Hilprecht referred his questioners to a volume by him then in the press. The promised volume was finally published last winter, and was reviewed in the columns of the *Nation*, May 2, 1907 ("The Babylonian Expedition of the University of Pennsylvania." Series A; Cuneiform Texts). It proved to contain no answer whatever to the charges of falsification, and, so far as it bore upon those charges at all, rather increased than diminished their gravamen. The signers of the letter waited with commendable patience until sufficient time should have elapsed to enable them to consider the contents of the volume and ascertain the judgment of other scholars on the facts. Their original letter to Professor Hilprecht and his answer are now given to the Oriental and archæological public, with an introductory note by Professor Lanman of Harvard, stating the occasion of that letter and the cause of its present publication, viz., the failure of Professor Hilprecht to offer any satisfactory explanation of the charges of falsification made against him in the matter of the Nippur Temple Library.

NEWS FOR BIBLIOPHILES.

On November 25, 26, and 27 C. F. Libbie & Co. of Boston hold an important sale, Americana for the most part belonging to the late Matthew A. Stickney of Salem, Mass. Among the unusual items are early American almanacs. There are 134 lots dated before 1800, the earliest a copy of Samuel Brackenbury's "Almanack for 1667" (lacking title-page). A perfect copy brought $275 in the French-Chubbuck sale in 1904. There are thirteen other almanacs before 1700: Dudley's for 1668, Brown's for 1669, J. R.'s for 1670, D. R.'s for 1671, N. H.'s for 1673, J. S.'s for 1674, Foster's for 1675, Tulley's for 1690, 1691, 1692, 1695, and 1698, and Newman's for 1691. The earlier ones were printed in Cambridge, but from 1690 on they are from Boston presses. Among the eighteenth century almanacs are several interesting ones of Bickerstaff's series, with curious portraits of Hancock, Joseph Warren, Ethan Allen, Washington, and others. An original impression of Paul Revere's engraving, "A Westerly View of the Colledges in Cambridge, New-England," is an important item. No copy has been offered at auction for many years, if ever. The Stickney specimen is fine and clean, mellowed by age, with full margins, and is in a contemporary black frame. The only copy known to Mr. Goss, when he published his life of Revere, was that in the Essex Institute. Revere, who was the engraver of the paper money of Massachusetts, cut this copper-plate in half and engraved some bills on the reverse. This half, the left, is preserved in the State House, Boston. Another Revere item is a perfect copy of Billings's "New England Psalm Singer," 1770, with the curious frontispiece and 108 pages of music, all engraved by Revere. The only other perfect copy offered at auction brought $226 at the Bartlett sale in 1903. The series of election sermons of Connecticut and Massachusetts is uncommonly long. An original water-color by Christian Remick with the title, "A Perspective View of the Blockade of Boston Harbour, Islands and Men of War and the landing of the 29th and 14th Regiments on the first of October, 1768, as taken from ye end of the long wharff," is similar to one which brought $900 in the Whitmore sale. A third drawing of the same scene by the same artist is in the collection of the New England Historical and Genealogical Society. Among first editions is the rarest Hawthorne item "The Sister Years," being the "Carrier's Address" for the Salem *Gazette* for January 1, 1839. It is an eight-page octavo pamphlet, sewed and unbound, as issued. Only one copy has been sold at auction, bringing $290 in the French-Chubbuck sale in 1904. Audubon's Birds and Quadrupeds, 10 vols.; the *New England Historical and Genealogical Register*, 60 vols.; The New Hampshire Provincial Papers, 28 vols., and Savage's "Genealogical Dictionary" are among the rare sets.

On November 25 the Anderson Auction Company of this city offers a collection of autographs, miscellaneous in character, but including an L. S. of Washington to Col. Van Schaick and another to Brig.-Gen. Parsons; a legal document in Lincoln's autograph; several war telegrams in Grant's autograph; an L. S. of Lee to Grant in reference to exchange of prisoners; documents signed by Simon Bradstreet, Gen. Burgoyne, John Hancock, and Napoleon I.; and full autograph letters signed by Andrew Jackson, James Buchanan, Grover Cleveland, R. B. Hayes, Henry Clay, James Fenimore Cooper, Longfellow, Bret Harte, E. A. Poe, William Gilmore Simms, Sir Walter Scott, and Charles Dickens.

There are several Browning items of "association" interest in the William H. Buckler collection, to be sold by the Anderson Auction Company on December 3. Chief among them is the collection of proof-sheets of "The Ring and the Book," with copious manuscript corrections by the author. They were sent to the late Moncure D. Conway for use in preparation of reviews for American periodicals. They are accompanied by a four-page letter from Browning, in which he says:

> It is arranged that two volumes shall appear in the U. S. on Dec. 1; and the third and fourth, also together, on March 1. Hence the publication of Vol. 2 will anticipate the appearance of the English edition by a month.

This seems to show that the actual first edition of the second volume of "The Ring and the Book" was the one published in Boston. These proof-sheets were bought by Mr. Buckler at the William Harris Arnold sale in January, 1901, for $680. Two copies of "Dramatis Personæ," 1864, were purchased at the same sale. One, a proof, also given to Conway, has his certificate on the fly-leaf that all the writing in the book (except his note) is in Browning's autograph. It cost Mr. Buckler $455. The second, a presentation copy from the author to his uncle, Reuben Browning, contains an autograph inscription. "The Agamemnon" is also a proof-sheet, with numerous autograph corrections and an interesting letter relating to them, addressed to G. Barnett Smith. "Balaustion's Adventure," 1871, is a presentation copy to D. G. Rossetti. This brought £7 at Sotheby's in 1899. "Red Cotton Night-Cap Country," 1873, is a presentation copy to Lord Coleridge. Another presentation copy of this book brought $60 at the Arnold sale. "Pacchiarotto," 1876, likewise a presentation copy, contains a few autograph corrections by the author.

The library of Francesco Crispi is to be dispersed. To those familiar with the life and character of the Italian statesman this cannot be other than unwelcome tidings. Crispi was a true bibliophile, but the large library which he brought together, occu-

pying seven rooms in the Villa Lina and three in the adjoining Villino Linguaglossa at Naples, was more than a great collection, it was created with a view to its owner's needs in public life; and the interior and foreign policy of Italy, which he moulded for many years, was worked out under its guidance. Crispi loved his books, and lived much among them. His favorite section was that of the rare files of newspapers of the early heroic days of the Risorgimento, in the ranks of whose editors he had fought with distinction. In them, and in the political pamphlets and broad-sides that he had collected, lay revealed the soul of modern Italy. His collections on constitutional law, diplomacy, jurisprudence, geography, and history were unusually rich, but one novel only was found on his shelves, Alessandro Manzoni's "I Promessi Sposi," and it found its way there as the great classic of the Risorgimento. The library was arranged by Crispi himself, who was his own librarian, works upon the same subject being grouped together. And as he left them, they have been registered, as far as possible, in the catalogue of the auction sale which is to take place in Rome in December. Happily, the city of Palermo has purchased privately the whole section on Sicily, and the Italian Government all that relates to the Risorgimento. The latter will form a nucleus of a library of national history—the history of the making of modern Italy—which will be placed in the great chambers of the lower part of the monument to Victor Emmanuel in Rome, which was begun in 1885, and is expected to be dedicated in 1911. At one time it was thought that one of our American libraries might take the whole Crispi library *en bloc*, but the price demanded was beyond the commercial value. It is still possible that important purchases will be made at auction on American account.

Last week we printed in this column a few of the prices paid at the auction of the Earl of Sheffield's books at Sotheby's, London, November 4 and 5. We note in addition that three of the quarto tracts relating to King Philip's War sold as follows: "A farther briefer and True Relation of the late Wars risen in New England," 1676, 6 leaves, £109. There is a copy in the Lenox Library, but no other seems to have been offered for sale in recent years. "News from New England, being a true and last Account of the Present Bloody Wars betwixt the Infidels, Natives and the English Christians, and Converted Indians of New England," 1676, 4 leaves, £118. There are copies in the John Carter Brown, Lenox, and Ayer libraries, and a fourth in a private collection in New York. "The Present State of New England, being a Narrative of the Trouble with the Indians," 1677, £50. Other lots sold as follows: Eliot and Mayhew's "Tears of Repentance," 1653, £17 17s.; Whitfield's "Strength out of Weakness," 1652, £25; Thomas Morton's "New England Canaan, or New Canaan," 1637, £60.

Bibliofilia for September-October is mostly given up to continuations—the interesting Portolano (pilot's book) of Graziosa Benincasa, which, in this instalment has a chart of the Mediterranean with courses; a transcript, with facsimile, of the statutes of Castel Genovese, Sardinia, fourteenth century; and a considerable addition to Cellini bibliography, by Sidney Churchill. There is besides a short essay on ancient musical notation by Arnaldo Bonaventura. The editor, Comm. Olschki, enlarges upon the needless trials involved in exporting books older than 1800 from Italy. Technically a permission (*nil obstat*) should be procured from designated offices. Practically, busy librarians are disinclined to bother with this bibliographical small fry. But the shipper who sends off an uncertified box, runs the chance of having it stopped by a zealous and ignorant customs officer. This befell Comm. Olschki for sending in a general consignment, without the *nil obstat*, a Cæsar printed in London in 1712. Foreigners, who take books into Italy to be bound or for their personal use, should be advised that reëxportation may be attended by vexatious delays and expense, unless a certificate of temporary importation is secured.

Correspondence.

RURAL SCHOOLS FOR CITY CHILDREN.

To the Editor of The Nation:

Sir: I have scanned the correspondence columns of the *Nation* for the past month in expectation of some comment on your editorial of October 3, entitled "The Lock-step Again." As none has yet appeared, I am venturing at this late date to offer a few words on a phase of the subject which may be helpful and suggestive to parents. When a child's health and mental development can keep pace, rapid advance in schools is well enough. But there are many children who are quick to grasp subjects presented to them, and who can easily outstrip the average pupil, whom it is unwise to promote for fear that the sustained strain of attacking new matter may break the health. On the other hand, if left in the same grade till the lock-step advances him, the bright child either gets into mischief or becomes lazy or apathetic. This is the opportunity for taking him out of school and making a change in his work and surroundings. This is where the usefulness of some kind of rural outdoor school would come in. Here and there a parent will take this period for an interval of outdoor life for the child, with, perhaps, one or two studies not usually pursued at school, as German or French, a science, manual training, cooking, sewing, or music. The remainder of the year might be thus employed, with the exception of the last few weeks, when the child could be returned for the formalities of reviews and examinations. This plan has been successfully carried out in many individual cases; it remains for the wise forethought of some exceptional school board to establish a properly equipped and conducted school of the sort indicated, which shall be open to the public of a great city. Local trains returning to the suburbs empty after the morning rush to business, might carry the children out to such a school, and reverse the process in the afternoon. The term of attendance and the subjects pursued should be left open to suit the needs of individual students. Such schools would simplify and often eliminate problems of discipline and hygiene which under present methods are unsolved and unsolvable.

As to the absurdity of the lock-step methods—I have in mind one child who was taken out of school thus each time that the teacher of the grade and the principal declared her able and ready for the next grade. At other times, when well in advance of her class, she was kept out of school for two or three months at a time, and usually was sent back at the close of the term or year for examinations; but she was never advanced to the next grade until the class was promoted. This method took the assistance of the family physician and some diplomacy; but it kept the child from a nervous breakdown, frequently threatened, and brought her to the age of fourteen and the high school with a physical development decidedly in advance of that of the average city girl of her age. A count of the time spent in school showed the work of the eight grades accomplished in forty-three, instead of eighty months, while two prizes, involving scholarship, were awarded at graduation. In another instance, where health was of less consideration, a boy was advanced whenever he showed sufficient familiarity with the grade requirements. This gradually resulted in bringing the child into contact with pupils several years older than himself; and when it came to high school work he was found too immature for the English courses and for history. In the end it became necessary to keep him out of school until he grew up to the place he had won by mere precocity. These children are cited as types easily duplicated anywhere among bright boys and girls. Their experience seems to illustrate the need for the rural ungraded, or only partly graded, school as above indicated; but the demand for such schools will only come with a fuller understanding of the conditions than now exists.

Sarah Willard Hiestand.

Chicago, November 10.

THE NEWFOUNDLAND FISHERIES CASE.

To the Editor of The Nation:

Sir: Will you allow me to make a few comments upon the letter of Judge D. W. Prowse in your issue of October 3 in regard to the dispute over the Newfoundland fisheries? The charge of smuggling which first he made against the Yankees, then against the French, he now repeats against American fishermen; but would there be "smugglers" were not Newfoundlanders ever more than ready to lend a hand? Would there be "smugglers" were it not for the system of oppressive protection which burdens the poor fishermen of the island? Judge Prowse waxes eloquent in his denunciations of "the outrageous tax of three-quarters of a cent a pound upon all fresh fish imported into the States," which compels "eighty millions of Americans to eat dear fish"; but would not his free-trade homilies, which I approve with all my heart, be better worth while nearer home, where protection makes bread scarce? Is the protection on fish to enrich "Lodge's smugglers," that is, American fishermen, more to be condemned than the tax imposed upon the necessaries of Newfoundlanders for the enrichment of the merchant clique of the island?

Judge Prowse has written upon French

fisheries in the same strain in which he new writes upon the American. Unfortunately a whole mass of French documents has apparently remained inaccessible to him. Thus he ascribes the settlement of the French Shore question, in the terms of 1783, to the desire to make "the Bourbons more acceptable to the French." Were he to read the Anglo-French diplomatic correspondence from 1776 to 1783, in the archives of the Quai d'Orsay, he would clearly see that the British Government did not look after the interests of the Bourbons, but after its own. Again, French rights upon the French Shore were not "virtually" but really exclusive. This was acknowledged by the British Government, and, in fact, Judge Prowse himself says in his letter, "England at the time had no fishery rights to give away." If that is the case, French rights must have been exclusive. Yet he fought the French—as he now fights the Americans—while in the full enjoyment of their historic rights.

As to the Anglo-American controversy—without being indifferent to the well-being of Newfoundland, we must set aside the constant family quarrel between the colony and the Mother Country. Great Britain has shown unlimited patience. A mere handful of militant Newfoundlanders have been unable to see the sacredness of international pledges. The ideal of the politicians of St. John's would be that they should deal directly with the Powers, and should carry out, as they like, their own petty designs without the least regard for the other parts of the Empire. This, however, is a strictly British question. The great thing for Americans to know is what the United States is entitled to on the French Shore, for Judge Prowse has laid stress upon that part of the fishing-grounds. Indeed, as he says, England had no rights on this part of the coast, but, what is important in this treaty, she assumed that she had. Certainly she had fishery rights, and granted them, on the South shore, from Cape Ray to Rameau Island—not to speak of other points. The prerogatives granted, in 1818, could not be subjected to the laws of a Colonial government which was not then in existence, and was founded only in 1832. Now, where is the "intolerable burden on a British colony"? The Americans did not set out to disturb the provincial government, but the provincial government, coming into existence, disturbed them. This was done notwithstanding the fact that Newfoundlanders had pledged themselves to respect the treaty rights of other Powers. The Americans therefore secured privileges free from all the restrictions which the men of St. John's wish now to impose upon them.

It is well known that the British policy in Newfoundland was adverse to all colonization. The French were to keep their coasts, as the British were theirs, in both cases absolutely for the purpose of fishery. There was to be no settlement, either British or French, on their respective shores. The rights of France, impaired for a while, were restored to her in 1783. The British who had settled upon the French Shore were removed by an act of Parliament (Act 28, Geo. III., c. 35). Henceforth the Treaty Shore seems excluded from British jurisdiction. The British fishermen, entitled to bounties from their government, cannot report on the French Shore (Act. 26, Geo. III., c. 26). The British subjects protest against their expulsion by French officers. Some would fish illegally, but do not "for fear of their boats and ships" being seized by the French (First Report of the Committee to inquire Into the State of Trade in Newfoundland, p. 393). French officers are forced by their instructions to compel British settlers to retire, and, in case of resistance, to transport them to St. John's (Affaires étrangères, France et Angleterre, F. 556, p. 25). Chevalier de Vaugiraud says, in 1789, that French officers claimed "exclusive rights of judiciary coercion" (Id. F. 571, p. 5). Gov. Cochrane will "request the French authorities to seize and to send to St. John's all persons" committing depredations on the French Shore (Proclamation, June 8, 1827). In 1830, he declines to interfere there (Robinson: House of Commons, May 11, 1830) and during the next year French officers send away a Newfoundland vessel (Id., September 13, 1831).

Not only did the French exercise jurisdiction, but the British government was careful to prevent any local institution from interfering with treaty rights. When the circuit courts were instituted everywhere in the island, none were to be on the French Shore (Proclamation of Sir John Cochrane, December 10, 1825). The Supreme Court cannot require its sheriffs for service on the French Shore (Rules and Orders of the Supreme Court of Newfoundland, Art. VIII., 1825). When local government is granted in 1832, electoral franchise is excluded from the French Shore (Royal Proclamation, July 26, 1832). These facts show that at the time of the Anglo-American treaty in 1818, the British exercised no jurisdiction over the foreign Power on the French Shore, and that later on, when legal and political institutions were established, they excluded all on the French Shore, French and Americans, from the scope of their action.

For the other rights of the Americans—they antedate the existence of the Newfoundland government. Now, by what principle have the Newfoundlanders obtained jurisdictional rights over the Americans? When did these rights begin? Judge Prowse does not say. In his letter, as in his former utterances upon the Anglo-French controversy, anything which is not in keeping with the ideas of the men of St. John's is "obsolete," "a burden on a British colony." But is a British colony so sacred, and so above the common principles of international law, that great nations which have been important factors in civilization must bow before all its demands, and international pledges must lose their binding character? A competent international tribunal will not be much affected by such considerations, and will treat such legal juggleries as they deserve.

JEAN CHARLEMAGNE BRACQ.

Poughkeepsie, N. Y., November 6.

PLUTARCH ON THE VALUE OF HISTORICAL EVIDENCE.

TO THE EDITOR OF THE NATION:

SIR: In your review of Farnell's "The Cults of the Greek States" in the *Nation* for October 24, you comment upon the historical value of the evidence afforded by ritual. It is, perhaps, interesting to note that Plutarch recognized the value of such evidence. In his essay on Isis and Osiris, end of chapter xxxvii. (365 F.), he says:

> I pass by Mnaseas . . . and Anticlides . . . for the similarities that I have mentioned in the feasts and sacrifices offer a clearer proof [of the identity of Dionysus and Osiris] than the authority of writers offers.

This is but one of many instances in which the "unhistorical" Plutarch is conscious of historical values. ANNE HERSMAN.

Chicago, November 11.

Notes.

Chatto & Windus will soon have ready Swinburne's new tragedy, "The Duke of Gandia." The scene of the drama is laid in Rome in 1497, and deals with the murder of the brother of Cæsar Borgia.

Owing to the bulk of materials handled, the third volume of J. G. Frazer's "Golden Bough" will be issued as a series of monographs, viz.: (1) "The Magic Art and the Evolution of Kings"; (2) "The Perils of the Soul and the Doctrine of Taboo"; (3) "The Dying God"; (4) "Adonis, Attis, Osiris"; (5) "Balder the Beautiful." The first two monographs are promised for next year.

Putnams have issued the following new volumes in their Ariel Booklets: De Quincey's "Conversation"; John Bright's "The Trent Affair," "Slavery and Secession," and "The Struggle in America," in one volume; Plumtre's "Antigone of Sophocles"; Miss Mulock's "Adventures of a Brownie"; Miss Mulock's "Little Lame Prince;" and Ouida's "Nürnberg Stove."

The "Memoirs of Mistral," the French edition of which was reviewed in the *Nation* of January 1, has now been rendered into English by Constance Elizabeth Maud, and published by the Baker & Taylor Company. The lyrical poems have been done into English verse by Alma Strettell (Mrs. Lawrence Harrison).

William Morris's "Life and Death of Jason" has been issued by Longmans in their neatly printed Pocket Library.

Trollope's "Can You Forgive Her," in two volumes, has been added to John Lane Co.'s pocket edition.

Forster's "Life of Charles Dickens" is now published by Henry Frowde in a single volume uniform in style with the Fireside edition of the novels.

From the World Book Company, Yonkers, N. Y., comes a revised edition of the "Handbook of English Composition," by Luella Clay Carson of the University of Oregon. The volume is, according to the preface, "intended to include standard rules and usage, and a few fundamental processes—all designed to secure accuracy and something of effectiveness in the use of the essentials of English composition." The book is interleaved through with blank pages.

Whether you liked the novels of John Oliver Hobbes or disliked them, you at least had to acknowledge that they sparkled with clever, quotable sentences. A volume of her Wit and Wisdom, therefore, was inevitable, and such a volume, com-

piled by Zoë Procter, has just been published by the Frederick A. Stokes Co., under the title of "Life and To-morrow." The quotations, running from a short sentence to a considerable paragraph, are arranged by subjects, and there is a full index also for the aid of any who may wish to fortify their own wit surreptitiously.

John Addington Symonds's "Essays Speculative and Suggestive," first published in 1890, and since republished, but for some time out of print, has been brought out in a new edition by Scribners. A Preface, contributed by Symonds's friend, Horatio F. Brown, gives a number of interesting quotations from Symonds's letters, written while the book was preparing, and just after it appeared. The work was pretty severely criticised in the press, and at first the author took the censure to heart, but he soon looked at the matter more calmly, and professed himself ready to profit by the scolding. Some of the essays, nevertheless, particularly those on Style and on Walt Whitman, are in his best vein.

Leslie Stephen's "Science of Ethics," first published in 1882, is issued in a second edition by G. P. Putnam's Sons. In binding and general style the volume matches the collective edition of Stephen's works. The object of the book, as the author explains in his preface, is "to lay down an ethical doctrine in harmony with the doctrine of evolution." He differentiates his book from Spencer's "Data of Ethics," which professes the same end:

> Mr. Spencer has worked out an encyclopædic system, of which his ethical system is the crown and completion. I, on the contrary, have started from the old ethical theories [of Hume, Bentham, and the Mills], and am trying to bring them into harmony with the scientific principles which I take for granted.

It is not likely that the centenary of Whittier's birth, December 17, will be the occasion of much noise, and articles about him are conspicuously absent in the magazines. Perhaps centenaries were a little overdone last year. Certainly Whittier would not choose a boisterous celebration, but he would have taken pleasure in the selection of his poems brought out by Houghton, Mifflin & Co. in honor of the occasion. The book is printed in the best style of the Riverside Press, depending for its beauty on sheer excellence of paper and type. The poems are chosen so as to show the three periods of his career: the formative years, the political struggle, and "that mood of devout resting and waiting in which his long life closed." Bliss Perry contributes an introductory sketch of the poet's life, written in his pleasant vein.

The publication of H. Bellyse Baildon's edition of the Poems of William Dunbar (Cambridge University Press and G. P. Putnam's Sons) has been attended by more than one unfortunate circumstance. Apart from the tragic death of the editor, which followed the appearance of his book by only a few weeks, one may note the communications to different German philological journals in which Prof. J. Schipper, the greatest living authority on Dunbar, has denounced in terms of much severity the manner in which Prof Baildon has transcended the permission to make use of Schipper's edition of the poems, published by the Vienna Academy of Sciences. The same Academy has, moreover, taken formal action and forbidden the use of Prof. Schipper's edition in future issues of the present work. Prof. Schipper's complaint that the text and glossary are taken bodily from his work appears substantially justified; and one may add that whatever value the notes possess is in the main due to the same authority. Under the circumstances, it would have seemed better if the Cambridge University Press had invited Prof. Schipper himself to prepare a cheaper edition of Dunbar's Poems, still further adapted to a wider circulation by changes in the critical apparatus. As it is, we have, of course, a good text and glossary, and, in the main, adequate notes, but discredited by the circumstances which we have just recited. The Introduction, which, like the rest of the book, is dependent on other authorities, gives sufficient information in regard to Dunbar's life and the manuscripts of his poems. The same is true to a less degree of the sections on Dunbar's language. Various passages, however, in both introduction and notes cast doubt on the editor's philological knowledge, as, for example, the following singular explanation of the lengthening of certain vowels in open syllables in Middle English:

> But, by a process of absorption by which one vowel in a preceding syllable absorbs and is modified by another following vowel, which itself becomes silent, we have in such words as *name, shame,* and so on an original short *a* in *nama, sceamu,* giving us a long modified N. E. *a* (for ä).

"Sir Gawain and the Lady of Lys," by Miss Jessie L. Weston (London: David Nutt), is the seventh volume in the dainty series of Arthurian Romances Unrepresented in Malory's "Morte D'Arthur." The merit of this series is too well known to need further commendation. The present volume is a paraphrase of a portion of the continuation of Chrétien's "Perceval," by Wauchier de Denain, viz., that which relates Arthur's expedition to the Castle Orguellous to release Giflet fis Do and the siege of this castle. The story, which gives its name to the volume, is well told; but more famous are the accompanying episodes of Kay and the roast peacock and Gawain's courtesy to the Rich Soudoier, which were used by the author of the Scottish romance of the fifteenth century, "Golagros and Gawane." Miss Weston follows in the main the text of MS. 12576 of the Bibliothèque Nationale.

E. K. Chambers and F. Sidgwick have made an excellent selection of "Early English Lyrics, Amorous, Divine, Moral, and Trivial," which A. H. Bullen has published in thoroughly suitable form. The plan of transcription has been to leave poems written before 1400 practically in the original spelling, to normalize slightly those of the fifteenth century, while those of the early sixteenth century are completely modernized—a serviceable compromise where no thoroughly consistent system can be carried through without rebuffing the reader of general culture for whom the volume is designed. Mr. Chambers provides a well-constructed essay on "Some Aspects of Mediæval Lyric," in which he dwells first on the relation in France between the *chanson populaire* and the *chanson courtois,* and then passes to the song in England, showing its relation to French models and noting the new spirit of individualism and realism introduced by the island singers. Fortunately the ballad does not fall within his survey, so that he is saved from committing himself on that thorny question. Sources and elucidations are given in the notes. Altogether, the book may be commended for its convenience and taste.

Were the reader informed with what purpose and for what public George E. Woodberry's "Appreciation of Literature" (New York: The Baker & Taylor Co.) was written, he might judge it more indulgently. On its face the book is intended as a popular introduction to the art of reading, with an opening chapter on "First Principles," in which the writer attempts a definition of literature, art, criticism, and such like elementary matters. Then follows a discussion of the various prominent *genres,* Lyric Poetry, Narrative Poetry, Dramatic Poetry, Fiction, and so on. Its popular destination, if the inference from its appearance is correct, may account for the extreme generality of its remarks as well as for their commonplaceness—all of which might be pardonable in a casual or occasional address, but which are hardly sufficient recommendation for print. Critically the book is slight. And yet by readers at a certain stage of culture it might be found suggestive and even stimulating. At the same time it is for just such readers that a good many of Mr. Woodberry's statements seem misleading, if not actually dangerous. To call Shelley's "Prometheus Unbound," for instance, "the only great play of the English genius in modern times," is to run great risk of misleading seriously such a reader as has been supposed; for it is hardly a play at all except in a very special and limited sense, nor can it with propriety be called dramatically, even if poetically great. To declare that a thorough reading of Shakespeare "so shapes and informs the mind that no part of imaginative literature will thereafter be dark to it," is to deny altogether that other more regular, contemplative, and philosophic sort of genius represented by Sophocles and Racine—the genius of that moral order which Mr. Woodberry denies to Shakespeare. As a guide Mr. Woodberry is far safer when insisting that "a degree of formalism is indeed inseparable from literature," unfashionable though such a doctrine may happen to be nowadays.

It is perhaps needless to say that a book like Miss Marian Edwardes's "Summary of the Literatures of Modern Europe (England, France, Germany, Italy, Spain), from the Origins to 1400" (E. P. Dutton & Co.) is not a work of independent authority. For our own part, we confess that we do not understand to what class of readers it is addressed. Such a book—in the main, bibliographical—is not likely to appeal to any but professional students, and this class of readers will surely prefer to go at once to the sources for the individual literatures which Miss Edwardes herself has used, rather than consult them at second hand in the present work. This would be true, even if Miss Edwardes had executed her task with accuracy, which is far from being the case. To select an error which we note on the second page, the sweeping assertion is there made that "the structure of the verse [Anglo-Saxon] is trochaic." We should like to know in what sense this is true of Sievers's types B and

C, to say nothing of D and E. In the bibliography of "Beowulf" Miss Edwardes curiously omits to mention the only independent and by far the most scholarly edition of this poem which has been published in English, namely, that of her countryman, A. J. Wyatt. While we are on the subject of editions, we may remark that Miss Edwardes habitually confounds the new Albion Series of Anglo-Saxon and Middle English Poetry, edited by Bright and Kittredge, with the old Library of Anglo-Saxon Poetry, also published by Ginn & Co.—certainly no compliment to the later series. We have no space to record the innumerable omissions and errors which we have observed in the English Literature division of this work. What, for instance, is the value of a bibliography of Layamon's "Brut" in which not one of the important studies on the sources of this poem is mentioned—neither Wülker nor Brown nor Imelmann? It is no better with the sections on French Literature. For instance, no edition of the complete "Pèlerinage de Charlemagne" is mentioned. Under the heading of an "edition" of the Arthurian romances Miss Edwardes gives Paulin Paris's well-known work, "Les Romans de la Table Ronde," which surely she must have known was not an edition of anything, but merely a paraphrase in modern French of the Walter Map cycle of the prose Arthurian romances. But enough has been said, we believe, to show how defective this work is, notwithstanding its occasionally useful citations of recent literature.

From James MacLehose & Sons, publishers to the University of Glasgow, come the first two of four volumes of Fynes Moryson's "Itinerary." Morison, who was born in 1566, travelled widely in Europe; in 1617 he published an account of his journeys. This, the first complete reprint, is uniform in style and binding with Capt. John Smith's "Generall History of Virginia, New England, and the Summer Isles," and William Lithgow's "Totall Discourse of the Rare Adventures and Painefull Peregrination of long Nineteene Yeare's Travayles." The Macmillan Co. is the American agent for these beautifully printed books.

A handy little volume, "Things Seen in Egypt," has been prepared by Olive Holland (E. P. Dutton & Co.). It contains fifty half-tone illustrations which are well selected and well made, though some of them are not of most recent date. The only criticism to be made upon them is that they are scattered through the two hundred and fifty pages without much reference to the adjoining text. We have noted only one case in which the descriptive text beneath the picture is misleading, page 120, where "Thebes" is used for the more exact modern "Luxor." The book is chatty, and will serve either to prepare the intending visitor for what awaits him or to recall vividly some of the things that one has already seen. The book is not overburdened with ancient lore, and it is not heavily indebted to "Baedeker." Indeed, a little more study on certain points would have improved the treatment and given it a greater value. For instance, the naïve wonder expressed over the ability of the Egyptians to move and handle such huge blocks of stone as are built into the temple of Karnak and into the pyramids of Gizeh might have been replaced by an explanation which is to be found in the methods now actually employed by those who are restoring the falling columns. An inclined plane of earth was formed, up which the stones were dragged by main force. Just before the completion of an Egyptian temple it must have been full of earth to the very roof, and the last task was the removal of this very solid "scaffolding." Leading to each pyramid was an embankment of dirt, up which the stones were drawn. Pyramid and dike rose simultaneously. The wonder is not here, but in the fact that the stones were put into place without injury to corners and edges. The author fails to note adequately one monument at Karnak which is suited to elicit more wonder than all the rest: the obelisk of Queen Hatasu. The inscription on its base tells that it was quarried, transported, shaped, engraved, and set up in the space of *seven months*. It may be doubted whether any engineering or contracting firm in the world would undertake to duplicate the obelisk in the same time with all the resources of the present day.

The "Bibliographie géographique annuelle, 1906"—the September issue of the *Annales de Géographie*—is a valuable chronicle of the geographical literature of all nations. It is far more than a mere list of publications. To nearly all of the 1,113 titles of books, scientific papers, and government documents, there are appended explanatory notes by experts, sixty in number, including the editor, Louis Raveneau. His American collaborator is Prof. Benj. L. Miller. Some idea of the extent of the bibliography may be gained from the fact that there are over one hundred entries for northern Africa alone. A single title may include several works; under the San Francisco earthquake, for instance, fourteen separate articles or reports are given. The index of authors and travellers contains over two thousand names.

The house of U. Hoepli, in Milan, announces for publication in the near future the report of the journey in Africa, made by Prince Luigi Amedeo of Savoy, the Count of the Abruzzi, with Ruwenzori as the objective point; and "Metà del mondo visto da un' automobile," a description of a recent journey from Peking to Paris, written by one of the participants, L. Barzini.

What forty years can teach a Paris correspondent of a London daily about France and French politics may be found in the 376 pages (with 32 portraits) of W. F. Lonergan's "Forty Years of Paris" (New York: Brentano's). The first chapter starts with glimpses of the Second Empire, as seen by a young Irishman, who comes to study for the priesthood, but branches off into journalism; the last chapter takes us down to the Clémenceau ministry and the separation law, as seen by the now experienced correspondent of the *Daily Telegraph*. Mr. Lonergan has witnessed a good deal of French contemporary history. He has attended sittings of the Chamber and the courts, met many politicians and men of letters, unhitched Boulanger's carriage, talked with Clémenceau, interviewed Zola, corresponded with Halévy, had a squabble with Sardou. In the midst of his feverish existence, however, he found the time to read something else than newspapers, namely, some books of Taine, Renan, and Abbé Loisy, especially the latter; and he gives us the benefit of his readings. While this narrative, covering the main events of recent history, does not take the place of Seignobos or Hanotaux, it supplements, thanks to its generous supply of gossip from the editorial rooms and the "brasseries," those more dignified and reserved chronicles. Though fairly reliable on political questions, and evidently well-grounded on religious controversies, the author is not to be trusted as a historian of literature. It is no crime not to know that Anatole France preceded Jules Lemaître by several years in the literary world, nor that the latter made his début in *La Revue Bleue*, and not in *Le Temps*. But the anecdote showing Émile Augier suddenly ceasing to write because he had just seen the once glorious Scribe scorned by a manager, illustrates the way an otherwise true story may be misconstrued when told by a reporter whose knowledge is largely derived from the press. In fact, Scribe died in 1861, and Augier stopped writing in 1878.

The third volume of Dr. Elroy M. Avery's "History of the United States and its People" (Cleveland: The Burrows Brothers Co.) fully maintains the reputation of its predecessors as sumptuous pieces of bookmaking. Such a wealth of illustration, and of so high a standard of excellence, has never before been lavished upon a history of America. In saying this, we do not mean to imply that we have here only a finely got up picture book, for the work has far more significance than that; but only that the illustrations are so appropriate and so well executed as to make these volumes, in many respects, a model of what an illustrated history should be. Dr. Avery's narrative grows more praiseworthy as it proceeds, while his style is less stilted and freer from mannerisms and fine writing than was the case in the first volume. The volume before us, dealing in general with the last half of the seventeenth and first half of the eighteenth centuries, covers ground which historians have too much neglected, yet a sure knowledge of which is essential if ever we are to understand the American Revolution. The planting of Carolina, Pennsylvania, and Georgia, King Philip's War, and the career of Andros in New England are the more familiar episodes in this period; and in regard to these Dr. Avery's narrative, while showing acquaintance with the newer as well as the older literature, gives us little that is novel. On the other hand, the course of political development in the older colonies, especially Massachusetts, Rhode Island, New York, Virginia, and Maryland, and the influence of English and Continental events on colonial politics, are traced with intelligence and skill; indeed, the volume is in this respect the most successful attempt yet made to bring out in a popular way the significance of this neglected period. There is a modern treatment of British trade policy and the navigation acts, a welcome chapter on the political administration of the colonies, and informing chapters on Florida, Canada, Louisiana, and French exploration in the West. Dr. Avery's narrative still makes a good deal of use of quotations, and he sometimes contents himself with presenting opposing opinions on a controverted point without expressing his own; on the whole, however, the very large

mass of material is well digested. If we cannot yet think his work great, there can be no question that it is extremely meritorious.

The period covered by the eighth volume of Worthington C. Ford's edition of the "Journals of the Continental Congress" (Government Printing Office), from May 22 to October 2, 1777, though one of incessant activity for Congress, was not a time of striking events. Congress continues to be occupied with the infinite details of administration, such as the settlement of accounts, the adjustment of disputes about privateers, the organization and discipline of the army, the restraint of disloyal persons, and the almost frantic search for military supplies and money; while in the direction of campaigns and the formulation of schemes of defence it assumes, as always, a conspicuous part. A stilted address to the public, May 29, in which the necessity of independence is again argued and ultimate success confidently predicted, reads like an attempt to keep up a much tried courage. The only large piece of constructive work was the organization, June 10, of a commissary department. At the same time a policy of retaliation in the treatment of prisoners of war was adopted, and ordered communicated to Lord Howe. Elsewhere one reads most often the painful story of demoralization. In June the drawing of bills of exchange on the American commissioners in France was authorized, the money with which to meet them to be derived from the sale of American products, which Congress undertook to export. The Silas Deane controversy enters the field with the formal repudiation by Congress, July 12, of Deane's contracts with French officers. Lafayette arrived, however, and was made a major-general. At the end of June the people of the New Hampshire grants were refused political recognition. Congress was still jealous of its dignity; it scored one Bedford for challenging a member, and forced him to apologize, and later censured Greene, Knox, and Sullivan for certain letters addressed by them to Congress. An order, July 29, for an inquiry into the evacuation of Ticonderoga was followed by the recall of Schuyler, and the choice of Gates as commander of the Northern army. On September 18 the approach of the British forced a hurried withdrawal of Congress to Lancaster, whence, on the 27th, it removed to Yorktown.

The latest issue of the Historical Manuscripts Commission of Great Britain contains the eighth report on the manuscripts of the Duke of Portland, that is, the sixth on the Harleian manuscripts, which form the major part of the duke's collection. The papers concern the years 1700 to 1708, when Harley was successively Speaker of the House of Commons and Secretary of State for the Southern Department, which included the colonies. The presence in a private collection of so large a body of official papers supplemental to similar papers now in official keeping is characteristic of British public records at the present time; and the lamentable fact remains that these important papers in private hands are far less accessible than are those in the national archives. The truth is that the personal papers, originally unarranged or at most only tied up in bundles, were easily carried away by the official in question on his retirement from office, under the misapprehension that such papers were his private property. In this instance, the papers, consisting largely of letters, petitions, memorials, abstracts, articles, lists, and the like, were afterward scattered, finding their way into the Portland collection, the British Museum, and elsewhere. The bulkier bound volumes, minute books, entry books, ledgers, etc., remained with the "office," and are to be found to-day among the departmental collections at the Record Office. The particular group calendared in this volume contains a number of documents of value to students of our colonial history, as follows: report of a Committee of Trade, hitherto unknown, even to Dr. Cunningham, appointed under the Great Seal in 1638, and again in 1639; a valuable petition regarding William Courten's claim to the island of Barbadoes, presented by his descendants; eight important letters from Bellomont regarding affairs in New York and New England, none of which are contained in the New York Colonial Documents; many letters from Edward Dummer, the originator of the packet postal system to America, in one of which announcement is made of the extension of the system from the island colonies to the Continental, together with a computation evidently made by Dummer that at that time (1704) at least 100,000 letters were annually sent to the colonies, and as many returned; many papers throwing light on Kidd and his operations; a few papers regarding the attempts of Dudley and Byfield to obtain charters of incorporation for the importation of naval stores that add a little information to what Miss Lord has written on the subject; and, finally, two papers, one relating to the well-known case of William Atwood, whom the editor here calls the "Governor" of New York when he was only the Chief Justice, and the other to his son, *Louis* Atwood, of whom so little has been known hitherto that even his Christian name has been uncertain.

The fifteen essays and summaries which make up the Proceedings of the British Academy for 1905-6 (Henry Frowde) are, needless to say, of special interest and value. Under the head of history and literature must be ranked "The Romanisation of Roman Britain," by Prof. F. J. Haverfield; Sir John Rhŷs's "Celtæ and Galli," and "Celtic Inscriptions of France and Italy"; Prof. W. Ridgeway's "Date of the Shaping of the Cuchulainn Saga," J. Fitzmaurice-Kelly's "Cervantes in England," and Dr. Alexander Souter's "Commentary of Pelagius on St. Paul." Philosophy is represented by Prof. G. F. Stout's "Things and Sensations" and Prof. Bernard Bosanquet's paper on the "Meaning of Teleology"; law by Prof. T. E. Holland's "Neutral Duties in a Maritime War" and Sir Edward Fry's "Rights of Neutrals," both of these illustrated by recent events. The only paper on language proper is Prof. W. W. Skeat's much-discussed "Problem of Spelling Reform." The items still requiring mention are Dr. Hodgkin's monograph on Ernst Curtius, Shadworth H. Hodgson's "Inter-relation of the Academical Sciences," Prof. Silvanus P. Thompson's "Petrus Peregrinus de Maricourt," Sir H. C. Lyall's summary on "The Moghul Empire in Relation to the History of Modern Asia," and that of D. G. Hogarth on "Artemis Ephesia." The volume also contains obituary notices of three of the fellows: Sir Richard Claverhouse Jebb, Dr. David Binning Monro, and Prof. Frederic William Maitland.

Wilhelm von Schnehen has recently published "Der Moderne Jesuskultus" (Frankfort a. M.). The author, himself not a defender of the traditional conception of Christ as the Son of God, nevertheless maintains that the substitute offered by modern liberal theology, in its cult of Jesus as the greatest among men, a model in principles and practices, is unsatisfactory. His objection is that the new view lacks the inner substance which the old faith in Christ as the Son of God gave to Christianity; and that it does not do justice to the intentions of the Gospel writers in their portraiture of Jesus of Nazareth. The author maintains that this modern, weakened conception of Jesus can never satisfy the religious needs of man or of men; but he does not supplement his negative thesis by suggesting a positive substitute.

Roman Catholic scholarship can point with a pardonable pride to the first volume of a work on travel and investigation, recently published under the auspices of the Vienna Academy of Sciences by Prof. Alois Musil, who holds the Old Testament chair in the University of Olmütz. The book is entitled "Arabia Petræa: I. Moab, Topographischer Reisebericht" (Vienna: Alfred Hölder). This volume is accompanied by map of Arabia Petræa, on the scale of 1:300,000, 3 sheets. The author went to Jerusalem in 1895 to engage in Biblical studies in the École pratique d'études bibliques of the French Dominicans. He spent three years in the Holy Land, paying special attention to the classical Arabia Petræa, essentially the Old Testament Moab and Edom. Then, beginning in 1898, he devoted several years to cartographical investigations in Vienna, London, Cambridge, Berlin, and Constantinople. Three further expeditions filled out the years 1900-1902; and since that time the author has been engaged in arranging his vast material for publication. His present work has been preceded by two quarto volumes, entitled "Kusejr 'Amra," describing a small palace dating from the first half of the eighth century. This structure, discovered by Musil, is ornamented with rich Greek paintings, here reproduced in the original colors. The present first volume of the new series contains about one-half of the author's topographical report of his journey; that is, substantially the text and the illustrations for the northern half of the accompanying chart. The details of his research are set down with great exactness, and this material is supplemented by a wealth of data on the traditions, customs, and civilization of these regions. These chapters are the more valuable because the author is a master of the native tongue, and enjoyed the friendship of the mightiest of the Bedawin tribes, the Beni Sahr. This first volume is to be followed by others on ethnography and epigraphy dealing with the life and character of no fewer than forty-eight tribes.

Among the literary first fruits of the work of the German Archæological Institute in Jerusalem, which is under the direction of Prof. Gustav Dalman of the Uni-

versity of Leipzig, are two small volumes: "Volksleben im Lande der Bibel," by M. Löhr, published as Vol. VII. of Wissenschaft und Bildung by Quelle & Meyer, Leipzig; and "Palästinische Kulturbilder," the joint product of R. Eckhardt, F. Zickermann, and F. Fenner, published by Georg Wiegand, also of Leipzig. All four of these writers, the first alone, and the other three as tent companions, have investigated Palestine independently of the dragoman and guide. Löhr has as his chief purpose briefly and clearly to describe the life and doings of the modern inhabitants of Palestine, male and female, at home, at work, in city, in country, in private and public life. The other three take the reader through the country from Dan to Beersheba, through the streets of Jerusalem, and to the quiet watchfires of the Bedouin, as also into the rush and noise of the great church festivities. The authors do not overlook the historic sites and the field for archæological research. The price of the first work is 1.25 marks; of the latter, which is amply illustrated, 5.50.

The fifty-fifth annual report of the Boston Public Library, just issued, has this to say of the open-shelf system:

Unquestionably the open-shelf system toward which public libraries have moved during the last ten years, is of great public benefit and convenience. That it promotes the use of books no one can doubt. It must be admitted, however, that there are serious evils attending it unless it is carefully guarded. If the missing books involved merely pecuniary loss the matter would not be of much importance. The expense might be charged to profit and loss, and considered justifiable in view of the advantages derived. But if books may be taken without observance of rules, made for the benefit of the library patrons no less than for the convenience of administration, and returned or not, as those who take them may decide, a tendency toward demoralization is at once established, affecting particularly the young. This is far more serious than the money loss involved.

Recently the library has tried in certain branches a plan which "contemplates the continuance of reasonable open-shelf privileges, guarded, however, so as to supervise and control more closely the young persons who use them." The essential points of the plan are as follows:

A library card or other ticket of identification must be presented at the custodian's desk before access to the children's shelves is granted; persons under eighteen years of age must conform to the same requirement before being admitted to the shelves containing non-fiction for adults; no one under eighteen years of age is permitted to have free access to shelves containing fiction for adults.

The librarian adds:

The restraint is of a kind that involves no great hardship, while at least permitting the custodians to scan more closely those who are admitted to the shelves. It is expected that the slight formality required in the presentation of a card at the desk will operate as a deterrent to the irresponsible visitor. The plan remains an experiment at present, but, so far as tried, it promises improvement.

Moncure Daniel Conway died suddenly in Paris on November 15. He was born near Fredericksburg, Va., in 1832, and went to Dickinson College, Pennsylvania, where he was graduated in 1849. At college he joined the Methodist Church and came under the anti-slavery influence of the Rev. Dr. John McClintock. After graduation, he studied law for a year at Warrenton, Va., and at the same time wrote for the Richmond *Examiner*. At this period he brought out a pamphlet, "Free Schools for Virginia," in which he urged the adoption of the New England common school system by his native State. At the age of eighteen he decided to enter the Methodist ministry, and was appointed to a circuit in Montgomery County, Md. Soon his faith in orthodoxy weakened, he withdrew from the Methodist Church, and entered the Harvard Divinity School, from which he was graduated in 1854. Returning to the South, he antagonized public sentiment by denouncing the mob murder, at Culpeper Court House, of a free negro named Grayson, whose innocence was, indeed, later established; and by defending the fugitive, Anthony Burns, who was brought back to slavery from Boston by the aid of United States marines. He then became pastor of a Unitarian Church in Washington, but his radical anti-slavery views displeased the congregation, and in 1856 he resigned and went to a church in Cincinnati. In the Presidential canvass of 1856 Mr. Conway worked zealously for John C. Fremont. In 1858 his first book, "Tracts for To-day," appeared. Two years later he founded the Cincinnati *Dial*, to which Emerson was an occasional contributor. On the breaking out of the Civil War, he went through Ohio, delivering addresses in favor of emancipation, and he spoke for the same cause in New England. Finally he became editor of the Boston *Commonwealth*, founded in the interests of emancipation. In 1863 he went to England to advocate the cause of the Northern States, both on the platform and in the press. Toward the close of the year he became the minister of South Place Chapel, Finsbury, and he remained in this charge until his return to America in 1884. Through all these years he kept up his literary activities, contributing largely to the periodicals, writing many books, maintaining associations with the staffs of the London *Daily News* and the *Pall Mall Gazette*, and sending correspondence to the New York *Tribune* and the Cincinnati *Commercial*. During his residence in London he made many friends among persons who were prominent in literature, art, and politics; and his "Autobiography" is filled with entertaining reminiscences of these intimacies. Starting as a Methodist, and then becoming a Unitarian, he eventually developed into a radical free-thinker. Among his books are: "The Earthward Pilgrimage," "Republican Superstitions," "The Sacred Anthology," "Idols and Ideals," "Demonology and Devil Lore," "A Necklace of Stories," "Thomas Carlyle," "The Wandering Jew," "Travels in South Kensington," "Emerson at Home and Abroad," "Pine and Palm, a Novel," "Life of Edmund Randolph," "George Washington and Mount Vernon," "George Washington's Rules of Civility," "Life of Hawthorne," "Prisons of Air, a Novel," "Life of Thomas Paine," "Barons of the Potomac and Rappahannock," "Solomon and Solomonic Literature," and "A Pilgrimage to the Wise Men of the East."

The death of Francis Thompson was announced from London, November 18. He was born in Lancashire, and was educated at Ushaw College, near Durham, and at Owens College, Manchester. He first came into general notice, when, under the influence of the Meynells, he entered a Catholic monastery and began to publish mystical poems, not always easy to understand, but sometimes shot through with gleams of rare beauty. He published several volumes: Poems," 1893; "Sister Songs," 1895, and "New Poems," 1897.

THE WORLD OF HOMER.

Life in the Homeric Age. By Thomas Day Seymour. New York: The Macmillan Company. $4 net.

The Homeric poems are not only, in Matthew Arnold's phrase, "the most important poetical monument existing," but they are, to borrow the terminology of a very different type of literary critic, among the most complete of human documents. Homer's reticences and idealisms may differentiate him from our conventional modern conception of the realist, but no *Comédie humaine* or natural history of a Rougon-Macquart family could photograph the complicated society of the nineteenth century as faithfully as the Iliad and Odyssey depict the simple life of the early Achæans. Homer, however, does not convey this information in set descriptions, except in the case of the garden of Alcinous, but by narration of action and incidental allusion. And so in the vast library of Homeric literature, critical, grammatical, controversial, archæological, Mycenæan, belletristic, a shelf or a compartment will always be reserved for books whose aim is to collect and present the enormous array of facts disseminated through the poems concerning the political, religious, and moral ideas, the family life, the geographical range, the acquaintance with plants and animals, the dress, the habitation, the arts and crafts, the methods of warfare, and the arms of the Homeric man. Scholars call such books "treatises on Homeric antiquities." Sociologists style them the "study of Homeric society," or the "evolution of Greek civilization." Not to go back to the eighteenth century manual of Feith, the voluminous prototype of all such books for our generation is Buchholz's exhaustive "Homerischen Realien," naïvely dedicated to "his Lordship the Right Hon. W. E. Gladstone, First Lord of the Treasury." This book ought to be, if it is not, the object of the well-worn anecdote of the German professor who recommended such a treatise as sparing the student the *ennui* of reading the poems themselves.

Professor Seymour's "Life in the Homeric Age," though a work of independent verification and research, may not unfairly be described as an English "Buchholz," more attractively and lucidly written, reduced to the compass of one portly volume, brought down to date, furnished with maps and excellent photographs of Greek scenery, beautifully printed on thick paper, and decorated on its binding with golden Mycenæan ornament. An introductory chapter of forty-four pages disposes of the Homeric question and of all critical, prehistoric, and Mycenæan problems. Professor Seymour is rightly distrustful of vigorous and rigorous theories. The Homeric question, even if some one of our hopelessly conflicting hypotheses be finally verified, is of no more significance for his present purpose than Matthew Arnold thought it for the translator of Homer. For the study of Homeric life we do not need to know whether the

Trojans were of Phrygian or of Greek stock, whether the Achæans were fair-haired northern invaders of the Balkan Peninsula or descendants of tribes that had occupied Greece for a thousand years. And, similarly, the Thessalian origin of Agamemnon, the identification of Greek gods with natural phenomena, and the allegorical interpretation of their intervention in human affairs, are not only not proved but not relevant. Of the Mycenæan and Minoan problems we need only know that, despite minor discrepancies at first exaggerated, scholars are coming to agree that the Mycenæan finds are the best illustrations of the life and art which Homer had in mind. The unity of each of the Homeric poems is such that we may fairly infer the impress of the genius of one great poet, who probably lived two or three centuries after 1200, the plausible date of the fall of Ilium. But it is not likely that we shall ever be able to discern with certainty the sutures between his work and the earlier material which he used, or the later interpolations of the rhapsodists. The poems may have been "sung to pieces" quite as much as "stitched together." Language and other signs indicate that we are in the presence of strata of different ages, but the scholastic prospector cannot trace the true Homeric gold-vein either by the presence or absence of iron, of dowries, or of temples, nor yet by the round shield and the cuirass, or by any other of the archæological tests that have been proposed of late. For the study of antiquity the poems are a unit. The promised third edition of Helbig's "Homerisches Epos aus den Denkmälern erläutert," which was to take account of chronological differences, has not yet appeared.

The larger part of this chapter, however, is devoted to an argument less vivacious, but more searching than that of Andrew Lang, in support of the contention that Homer did not archaize, and therefore depicts one consistent type of civilization which he knew. This view is supported by all analogies. Local color and the fear of anachronism are modern scrupulosities, of which naïve epic, renaissance painting, and even the Attic dramatists, know nothing. The artificial epics of Virgil and Apollonius of Rhodes sometimes coquette with them, but fail in that complete, though incidental, presentation of real life which is characteristic of Homer. The Homeric similes would be pointless unless taken from familiar experiences, and the fact that some things are mentioned only in the similes proves nothing unless it can be shown that they would naturally occur in the action of the poem. If Homer mentions writing but once we must remember that Greek literature was never bookish, and that Demosthenes and Æschines refer their illustrations from Greek history to oral tradition, and not to the historians. The fact that the Homeric warriors do not use coined money proves neither that it was unknown nor that it was consciously ignored. Skins were for decades the chief currency in the American backwoods. Professor Seymour will not even admit that the "divine silences" of Homer are intentional—his ignoring of purification for sin, the worship of the dead, and the darker aspects of life and religion, prominent in Hesiod. "In every case the silence is to be explained otherwise than as intended by the poet to avoid the mention of a recent custom."

These preliminaries settled, the remainder of the book is a systematic treatise on Homeric *Realien*, beginning with a chapter on cosmography and geography, and ending with warfare and arms. To sum up this mass of detail would be to write a primer of Homeric antiquities. There are few striking facts that call for explicit mention, and, owing to the sobriety and caution of Professor Seymour's method, there is still less to invite hostile criticism. He maintains a courteous reserve with regard to lively Gallic hypotheses about the localization of Polyphemus's eye in the Solfatara craters. Homer, he thinks, does not confirm recent speculations about the predominance of Phœnician influence in early Greece. The traditional praise of Homer's geographical exactness applies in strictness only to three or four epithets in the Catalogue of Ships. The conclusion of an excellent summary of the Leucas controversy is that scholars who conceive an Asiatic Homer, who may have known little of western Greece, will continue to believe in the traditional Ithaca, while those whom recent discoveries have led to look everywhere for a firm basis of fact underlying Homer's tales, will be inclined to accept Dörpfeld's theory. A special chapter on the Troad describes the plain of Troy in connection with Dörpfeld's revision of the British admiralty map, follows the fortunes of ancient Ilium down to the visit of the Emperor Julian, and outlines the history of the controversy between the partisans of Bunárbashi and Hissarlik, till its final settlement by the spade of Schliemann. In the account of the recent excavations issuing in the discovery that the sixth city from the bottom is Homer's Troy, and the more detailed topography of the seat of war, Professor Seymour merely follows Dörpfeld, whose more adventurous identifications, including the view that Troy had two gates, the Scæan and the Dardanian, he reports without affirming or denying.

The study of the Homeric state points out how little formal government was needed. Nothing is said of crime or lawlessness in Ithaca, left for twenty years without a king or an assembly. In the trial scene on the shield he conceives the question to be simply whether the ransom has been paid. The consent to accept a ransom was voluntary. Πολυκοιρανίη (Iliad, ii., 204) does not mean democracy, but anarchy. The readable chapter on woman and the family describes eight types of Homeric woman from Helen to Nausicaa. The suitor's gifts were not a purchase: "No one can suppose that Nausicaa was to be given to the highest bidder." Homeric dress and decoration are described in detail; but our knowledge of the precise nature of Andromache's complicated headgear, the terror of undergraduates, is not much advanced. While careful use is made of both literary and archæological evidence, there is no attempt to fit all Homeric houses to one rigid theoretical type. Telemachus's chamber περισκέπτῳ ἐνὶ χώρῳ was in a "sheltered," not a "conspicuous," spot of the beautiful courtyard. In many palaces the lord and lady probably slept in the room that served by day as the great hall. No new conclusions are reached in the problems of the structure of Odysseus's palace, involved in the slaying of the suitors. The frequent meat meals of Achæan chieftains, which provoke a smile in the modern class-room, were often merely conventional rites of hospitality. There was private property in land strictly entailed in the family, and also much public land from which *demesnes* were carved out for kings or for sacred precincts. Slaves were little more than clients or liege-men, or, at the worst, serfs, who could not be sold away from the land.

In the discussion of Homeric warfare chief emphasis is laid on the predominance of the individual, and the many indications that the numbers originally contemplated were much smaller than those given in the Catalogue of Ships, the Trojan Bivouac, or the Marshalling of the Myrmidons. We can hardly, however, be expected to take seriously the argument that the contingent of Rhesus numbered twenty-five men because he was sleeping "in the middle" and was the thirteenth man killed. In the final chapter on Homeric arms the ideas of Reichel and Robert are accepted in the main. But Robert's attempted use of them as re-agents in the chemico-philological analysis of the Iliad by "double decomposition" is ignored without polemic. We are simply told the facts about the big Mycenæan shield, the small round (Ionian?) shield, and the strange absence of the later cuirass from the later Odssey.

To thousands, tens of thousands, such details as these Professor Seymour lends all the interest that attaches to lucid order and simple systematic presentation. But the book is obviously suited for consultation or reading a chapter at a time rather than for continuous perusal. Illustrations by Old Testament parallels are frequent and apt, and occupy two columns of the index. But otherwise there is a paucity of literary illustration and of illuminating philosophical generalization. It would in the case of a professed manual of antiquities perhaps be unfair to dwell on a certain aridity of tone resulting from this suppression of the literary and poetic interest. But surely Professor Seymour conceives his task too narrowly when he omits all explicit treatment of Homeric psychology and ethics, to which the ponderous Buchholz devotes 384 pages. Psychology is touched on only incidentally in connection with the ideas about death and burial, and ethics receives a scant page or two in the chapter on the state. The word αἰδώς is lacking in the index, and, if we mistake not, in the text. Yet both to the Hellenist and to the general student of European culture the rudimentary but pregnant ethical conceptions and terminology of the Homeric man are quite as real and significant facts as the shape of his shield, or the locks of his door. Misprints and positive errors are rare. *Orsythyré* (p. 193) should be *orsothyré*. It is in the *Laws* rather than in the *Republic* that Plato explicitly restricts the sale of land (p. 238).

In conclusion, we would express the hope that Professor Seymour will find time to prepare an *editio minor* for the use of students. The present volume will be an indispensable work of reference in public and college libraries and a handsome ornament to private collections. But we fear that it is too bulky and too expensive for the students who need it in their reading of Homer. It is to be hoped that in such an edition illustrations like those used in Har-

der's "Wegweiser" (overlooked in Professor Seymour's bibliography) will be multiplied, and that Harder's practice of designating the books of the Iliad and Odyssey by large and small numerals instead of by the letters of the Greek alphabet, will be followed. Few scholars can verify references by the letters without hesitation, and no general readers. In a book which quotes but little Greek, and is obviously intended for English readers, they are a vexatious survival of obsolete pedantry.

CURRENT FICTION.

The Shuttle. By Frances Hodgson Burnett. New York: Frederick A. Stokes Co.

Whatever it may not be "The Shuttle" is the kind of book which is heard of for a season above the din of subway travel and between the pious silences of bridge. "Have you read ——?" is, to be sure, a question which demands nothing of the speaker or the hearer; it blesseth him that gives and him that takes. "The Shuttle" affords sufficient material for the conversational capsule. It is a story which would have a mild interest for most people, and about which nobody could conceivably have much to say. It is good in the sense that "Little Lord Fauntleroy" was good: it is all for the victory of virtue over vice, white over black, tit over tat.

Bettina Vanderpoel is a Fauntleroy in petticoats. It is hers in an unusual degree to guide, to comfort, and command, especially to guide and command; she is born into a world which awaits her conquering advent. She is provided with unlimited wealth, surpassing beauty, a remarkable mind, exceptional executive ability, unshakable courage, perfect manners, and a strong (if somewhat patronizing) affection for her kind. She is further provided with an idiot sister and a villanous brother-in-law; no wonder she enjoys herself. Exception might be taken to the villain as a shade more diabolical than even the code of melodrama permits. He is an extravagant caricature of the sufficiently absurd wicked baronet of legend; a silly ogre, a patent bogey. And it is against this man of straw that the fair Bettina's heroism is directed. Bettina is by no means equally ridiculous; if she were only suffered to make a mistake now and again, to lose her temper or her self-possession, to drop a stitch, she would be a really charming person. But nothing of the kind is tolerated; Mrs. Burnett holds her ruthlessly to her rôle. She is all that a heroine should be, a Lady Bountiful down to the familiar coals and blankets; a Britomart, not to be daunted by perils of land or sea. We know from the outset that Sir Nigel Anstruthers has not the ghost of a chance at her hands. Bettina's pauper lord is a "good fellow," and deserves a millionairess. For the rest, satisfaction is to be taken in the person of one G. Selden, agent of a New York typewriter company—a very good bit of "character" impersonation.

The Good Comrade. By Una L. Silberrad. New York: Doubleday, Page & Co.

A good story of an amiable English type. The Polkingtons are a down-at-the-heels upper middle-class family, the father a retired army officer—a feeble ne'er-do-well; the mother and two of the daughters are devoted to the task of keeping up appearances. Capt. Polkington is relieved of a gambling debt through the generosity of a stranger—an obligation which one member of the family determines to discharge. This is Julia, the Cinderella of the household. The means she proposes to herself are sufficiently quaint: to steal and sell a valuable tulip bulb belonging to a Dutch friend. She gets her opportunity, but finds herself unable to take advantage of it. The fact that the Dutch owner of the bulb is by this time in love with her has something to do with her scruples. So she contents herself with stealing a valuable chemical formula from another Dutchman (who is not in love with her), and sends it to her father's creditor, who has been trying to get hold of it. Naturally, he is also in love with her by this time. He is a middle-aged gentleman of the elegant British type, monocle and all, and of course he wins the good comrade. But in spite of the fancifulness of the plot and the conventionality of the hero, the book is not a silly one. Rawson-Clew may be forgiven for the sake of Julia, and Johnny Gillat, the dear little shabby old man whom she loves, does not need forgiveness on any grounds; an absurdity as lovable and as credible as Bella Wilfer's "Pa."

Mortmain. By Arthur Train. New York: D. Appleton & Co.

Mr. Train's books always appear to come under the heading of detective fiction; that is their quality, though as a matter of fact, the present volume is made up of adventure in China, New York, London, and Harvard in '64. Within their obvious limits, these stories are good. They are quick, lively, ingenious, better written than the majority of their class, more competently worked out, less childish. Mr. Train proves fully equal to holding the attention of any adult reader, and the justifiable trick with which "Mortmain" ends comes with a sharp surprise, even to the wary. "A Man Hunt" seems the modern New York equivalent for the complicated expeditions with which du Boisgobey thrilled Paris in the seventies; but "A Study of Sociology," with its sinister termination, gives a welcome glimpse of Mr. Train's special knowledge, and approaches more nearly to the realistic interest of "A Prisoner at the Bar."

The Radical. By I. K. Friedman. New York: D. Appleton & Co.

Were it not that an unmistakable earnestness of conviction pervades this novel, one's inclination would be to let it pass unmentioned, for a more ineffective attempt at bending language to the uses of art rarely falls under the reviewer's eye. Thus we read of true love's meeting:

> His long arms spread out, sweeping toward her, and he said, the words long contained suddenly bursting from him, "I love you, Inez, dearest," and she sank into them, sobbing. So falls dawn into the arms of day, easily, as nature, the mother of us all, orders it.

The submissive dawn in the present instance was a daughter of American plutocracy, reared among all the prejudices and self-complacencies of her class, but step by step, and not without passionate resistance, led out into a larger view. In this regeneration the eloquence and courage of the hero were largely instrumental. "His people were those who did the work of the world and stood by with hungry eyes while the mighty reaped the profits therefrom." Of humble parentage and mean education, Bruce McAllister had made his way, by sheer force of personality—rugged, assertive, uncompromising—out of the ward of his native city into the national House of Representatives and onward to the Senate. He was the champion of the downtrodden; and no one would guess the pitfall and gin that everywhere, especially in Washington, that great city, beset his path: the stolen letter, the broken promise, the villain behind the arras, the capitalists' conspiracy, the sirens that held out glasses of crême de menthe. "He was—oh, fortunately for him!—no more susceptible to the siren's plea than the glass her jewelled fingers clasped enticingly."

The Princess Pourquoi. By Margaret Sherwood. Boston: Houghton, Mifflin & Co.

The five tales which make up this little volume are wonder-stories with a moral. The "Princess Pourquoi" represents, let us say, the modern spirit of feminine inquiry in its dignified aspect; "The Princess and the Microbe" and "The Seven Studious Sisters" represent the same spirit in an amusing light; and "The Clever Necromancer," its pathetic side. "The Gentle Robber" is a more pungent satire upon the theoretical and the actual attitude of the world towards greed and dishonesty on a large scale. If our leading scoundrels of the type could conceivably feel the sting of any reproach, they might be expected to wince at such a scathing parable as this: the fie-fie of public opinion cannot, however, be expected to gall them greatly, so long as they still feel themselves safely at large. But altogether the most searching of these satirical fables is "The Clever Necromancer." The necromancer captures a whole city, or rather the whole feminine portion of it, by means of a series of bags of parti-colored wind, which he inhales and exhales to the wonder and delight of his fair audience. Disguised by the glorious tissue of this magic vocabulary, the homeliest platitudes arouse his hearers to ecstasy. Finally the trick is discovered by an honest burgher, whose sweetheart has been estranged from him by the charm of the necromancer. He steals the bags, makes sufficient public use of them to win back his lady, and thereafter keeps them for such occasional private use as her romantic appetite demands: "Far in illimitable recesses of time and of place," he began shamefacedly, "before phenomena existed, thy bodiless soul and mine met and mingled as one. . . . "

The Settlers. By Herman Whitaker. New York; Harper & Brothers.

This is a sufficiently animated account of agricultural life in the Canadian Northwest, with its mixed population of Canadians, Yankees, Irish, and English "remittance-men." Mr. Whitaker has a broad sweep over lumber camps, wheat fields, railroad and labor troubles. A suggestion of "The Virginian"—a lady succumbing to

the attractions of a rough diamond—is fully justified in an early chapter, where the author alludes to "a beautiful story. . . . that proved how easily a cultured Eastern girl might fall in love and marry a Western cowboy." That story, he decides, "ended just where in real life, stories begin." "The Settler," however, is a rapid, active tale of adventure; consequently the adjusting of Helen's marital relations with her primitive man has to be followed along rather superficial lines. Therefore, as the pair are reunited at the end of the book, as the result of a series of events which affect them externally rather than fundamentally, the question of permanent adaptation does not seem more definitely settled than after the first occasion when Carter suspects that Helen feels ashamed of him.

John Harvard and His Times. By Henry C. Shelley. With illustrations from photographs. Boston: Little, Brown & Co. $2 net.

Mr. Shelley's biography of the founder of Harvard College is an interesting and excellent volume. It is indeed remarkable that it has been possible to produce such a book about a man of whom twenty-five years ago almost nothing was known, this "New England Melchisedec, a priest of the most high God and a giver of gifts, without father or mother or descent, without beginning of days or end of life, his very grave being unknown." We wish at the outset to express regret that our author recognizes so inadequately the merit of Henry Fitz Gilbert Waters in the uncovering of John Harvard. Gratitude is expressed to "William Rendle and Mr. H. F. Waters"; their labors "have made this book possible." This is a meagre acknowledgment. It is unfair to name Rendle before Waters, or, indeed, to name him or any other man at all in connection with this investigator. Waters has been throughout the pathbreaker, as is evident to all readers of his straightforward résumé of his researches in the *Harvard Graduates' Magazine* for June last, and of his previous more elaborate contributions to the *New England Historical and Genealogical Register.* Of the new facts brought to light every one of interest we owe directly or indirectly to Mr. Waters. The baptismal record as to "John Harvye," in the Southwark register, had no value until his discoveries made it certain that "Harvye" was a misspelling for "Harvard"; John Harvard's mother remained entirely concealed until the revelation that she was Katherine Yearwood, widow of the Southwark member of Parliament; to Mr. Waters entirely do we owe our knowledge of the founder's interesting association with the Queen's Head Inn, the marvellous tracing out of John Harvard's connection with Stratford; the identification of the "Old House in High Street," as the home of his grandparents, Thomas and Alice Rogers, neighbors and intimates through many years of the family of Shakespeare. In establishing these points Mr. Waters did all the Napoleonic work. To fill out the framework was comparatively easy; Dr. Rendle made the picture more full by researches in the Southwark registers. As to the Stratford antecedents, when the clew was once obtained, much could be gained from Shakespeare scholars like Halliwell-Phillips. John Harvard's dates at Cambridge being once ascertained, Masson's "Life of Milton" becomes a royal road for learning about John Harvard's surroundings in college.

Having filed this exception, we cordially admit Mr. Shelley's scholarship, judgment, and good taste. In general he draws no inferences which cannot be allowed, showing much restraint in the midst of temptations to extravagant deduction. An exception to his usual caution is his conclusion from circumstantial evidence that William Shakespeare introduced to each other Robert Harvard and Katherine Rogers. This Mr. Shelley regards as almost certain, whereas we believe it to be only barely possible. Though at Southwark, near the Globe Theatre, Robert Harvard may easily have come face to face with Shakespeare, his calling as a mere tradesman, and his prejudices as a Puritan, must have stood in the way of a close acquaintance with a play-actor. In the sober-minded Rogers family, who must have remembered the dubious reputation with which Shakespeare left his native town, and who must have looked askance upon his profession even though he had won some success in it, his recommendation of a husband for a beloved daughter can hardly have borne much weight. We much prefer Mr. Waters's suggestion, that Thomas Rogers, a grazier and provision dealer in rather a large way, must have gone sometimes to the London markets, and that it was he who, seeing in his fellow-marketman, Robert Harvard, good timber for a son-in-law, managed that he should come to Warwickshire as a suitor. But this, of course, is mere conjecture.

In general, however, we think Mr. Shelley's inferences from the data at hand entirely reasonable; and when the picture is unfortunately obscure he shows skill in throwing upon it side-lights. For instance, as to John Harvard's boyhood at Southwark, concluding, we may say, with the plague-year, 1625, when his father, two sisters, and two brothers died within the space of five weeks, the details are meagre. Mr. Shelley, however, has found the diary of Nehemiah Wallington, a contemporary, living within half a mile, in the household of a Puritan tradesman precisely similar in fortune and position. The life in two such families must have corresponded narrowly, the daily record for one would to a large extent answer for the other, and Mr. Shelley's citations here are very appropriate.

John Harvard seems to have been in himself a correct and colorless personality, with mental and physical vitality sapped perhaps by an insidious disease. He never said a word, wrote a line, or performed a deed, except his ever memorable deed of gift, which his contemporaries thought it worth while to take note of and transmit. "He was a godly gentleman and a lover of learning," says the "New England's First Fruits." "This man was a scholar and pious in his life, and enlarged toward the country and the good of it in life and in death," writes Thos. Shepard, who was a young man like him, and who, as having been also at Emmanuel, must have known him well. It is good negative evidence of a proper course, as Mr. Shelley believes, that John Harvard's name does not appear in the list of admonitions. Our author, however, errs in saying that he received his degrees of A.B. and A.M. in the minimum time: for some unexplained reason he took an additional year. Possibly a hint or two as to his character may be gained from a study of the titles of his books, which he accumulated at much risk and expense in 1636. There is possibly a suggestion of candor in the appearance among the Calvinistic theologians of some of their Catholic opponents, like Bellarmin. Bacon's essays and Chapman's Homer presuppose literary taste, while a number of the best Greek and Latin classics bespeak liberal culture. With every aid that can be brought to bear the personality is, however, only feebly outlined, but in a marvellous way we have come to know John Harvard's antecedents and surroundings.

If it be urged that the foundation of undoubted facts is small for such a biographical superstructure as Mr. Shelley has raised, we may find a good illustration of the case in some stately Elizabethan building standing in the street of an old English town, the old house, let us say, in the High Street at Stratford. From the base, very narrow, the house rises high until you feel that it needs the support of the substantial masses of masonry to the right and left; while in front, the elaborately carved stories, each projecting well over the story beneath, and culminating in a beetling gable that fairly threatens the roadway, seem to need props for their support. Yet the house has entered upon its fourth century, and as the "Harvard House" we may hope will stand four centuries more. Not less enduring, we believe, will be these outlines of John Harvard's career, in our time revealed and set down. For a worthy of the Puritan age only a scriptural parallel seems fitting. Let us say then that he was an Apollos, no significant character, but living in a great age, and in illustrious companionship. Apollos watered; and what he watered was the perishing seed which the great apostles of the New England Church had too feebly planted—and God gave the increase.

Science.

Darwinism To-day. By Vernon L. Kellogg. New York: Henry Holt & Co. $2 net.

The rather formidable sub-title tells us that this volume is "a discussion of present-day scientific criticism of the Darwinian selection theories, together with a brief account of species forming." The keynote to the book is given in a single sentence:

> Both destructive criticism of old, and synthesis of new hypotheses and theories, are being so energetically carried forward that the scientific layman and educated reader, if he stands but ever so little outside of the actual working ranks of biology, is likely to lose his orientation as to the trend of evolutionary advance.

It is to supply such a means of orientation that the author has been led to make this exhaustive summary of facts and theories. After a chapter devoted to the definition of Darwinism and evolution, follow three others concerning the attacks which have been made upon the theory by theologians

and by biologists. The author then takes up theories supporting or alternative to selection and the formation of species.

Finally he discusses the present standing of Darwinism; and a few words concerning this important summary will indicate the real status of the subject. First, as to the actual definition of Darwinism: with the majority of people, the word is synonymous with organic evolution or the theory of descent as a whole. More correctly the term should be limited to several theories, the most important of which is that of evolution by natural selection; others are the more or less discredited theories of sexual selection and the pangenesis of gemmules. Professor Kellogg thinks that the theory of the descent of man from the lower animals may also fairly be included in Darwinism; for of all naturalists, Darwin was the first boldly to state the logical and obvious consequences of the widest application of the theory of descent, thus including the man in the chain of organisms linked by descent or ascent. But this general theory of the descent of man is not recognized by biologists as a special phase of Darwinism, but is commonly included as a part of the whole theory of descent, or evolution.

While the selection theories do not satisfy modern workers as sufficient in themselves to account for evolution as a whole, yet no satisfactory theory or hypothesis has been offered to replace it. Mutations seem too few and far between; for orthogenesis we can discover no satisfactory mechanism; and the same is true for the Lamarckian theories of modification by the cumulation through inheritance of acquired or ontogenetic characters. In short, the matter is still unsettled. And yet so important and so all-pervading is natural selection, that one additional theory may suffice. This crucial factor is needed to explain the beginnings of organs and structures—of variations. We need more than anything else a "satisfactory explanation of the pre-useful and pre-hurtful stages in the modifications of organisms: an explanation to relieve Darwinism of its necessity of asking natural selection to find in the fluctuating individual variations a handle for its action; an explanation of how there ever comes to be a handle of advantage or disadvantage of life-and-death-determining degree." Professor Kellogg adds:

> With such an explanation in our possession . . . we may depend with confidence on natural selection to do the rest of the work called for by the great theory of descent. Along all the divergent lines of development and change, instituted by this agent of beginnings, natural selection will choose those to persist by saying No to those that may not. And the result is organic evolution.

The candid attitude of the author is frequently shown and is an object lesson to many scientists who seem afraid of admitting ignorance in any department of their work. Professor Kellogg has no doubts as to there being "unknown factors" in evolution; he says:

> Let us begin our motto with *Ignoramus*, but never follow it with *Ignorabimus*. We are ignorant; terribly, immensely ignorant. And our work is, to learn, to question life by new methods, from new angles, on closer terms, under more precise conditions of control; this is the requirement and the opportunity of the biologist of to-day.

Occasionally, however, personal bias detracts from a fair weighing of pros and cons, and prejudice, we grant, is difficult to avoid in a work of such wide scope. Perhaps the most noticeable example is the tendency (reflected in most writers on evolution) to limit sharply the causes of variation and hence of evolution. Selection of one kind or another is set off as sharply as if it were a distinct concrete fact, unrelated to other factors. Far more rational is the point of view taken by Prof. H. F. Osborn in a recent address, in which he laid strong emphasis on the fact that there are four *inseparable* factors, interacting on each other and influencing the organism continuously from the very beginning of its life. These are heredity, ontogeny, environment, and selection, and a change in one of these affects the others.

While the book as a whole is intended for the general reader, the needs of the advanced student and the biological worker are met by an elaborate appendix at the end of each chapter, giving exact references to books and papers, and in some instances detailed accounts of pertinent observations and experiments. Although the volume contains comparatively little new work, it is none the less valuable as a summary to date of investigations. It complements, or supplements, "Evolution and Animal Life," recently brought out by the author in collaboration with President David Starr Jordan.

"Microscopy: the Construction, Theory, and use of the Microscope," by E. J. Spitta (E. P. Dutton & Co.), is a rather luxurious book intended for the instruction of beginners and the help of more advanced workers who are still unfamiliar with the principles involved. There are many illustrations of instruments and accessories, and extended discussions of structural details and of the theories of lenses, apertures, and illumination, with an instructive chapter on the use of condensers. While some of the questions considered may be better studied with the aid of a good text-book of physics, many readers will be glad to have so abundant material brought together in a convenient form and clarified by pictures showing the instruments and devices of a considerable number of makers. The problems of the micro-photograph are barely touched upon, the subject having been treated by the author in another book; those of ultra-microscopy are not mentioned.

A new edition, the second, of Howell's "Text-book of Physiology" (Philadelphia: W. B. Saunders Company), shows that this admirable book has in its first year found numerous as well as appreciative readers. The revision seems to be judiciously made, with reasonably full attention to recent investigations, and a conservative estimate of conclusions. Especially commendable is the adoption of a new nomenclature of the albuminous bodies, which, although necessarily tentative, will be found decidedly helpful.

The International Congress on Tuberculosis, to be held in Washington September 21 to October 12, 1908, will be the fifth of its kind, and the first to take place in the United States. It will carry on, for three weeks, public discussions, led by eminent authorities in this and other countries. There will be a course of thirty special lectures, to which all members of the congress and the general public are invited. There will be an exposition; and clinics and demonstrations will be held. A cash prize of $1,000 is to be given for the best evidence of effective work in the prevention or relief of tuberculosis done by any voluntary association since the last International Congress, in 1905. Another prize of $1,000 is offered for the best exhibit of a sanatorium for the treatment of tuberculosis among the working classes. A third prize, similar in amount, will be awarded to the best exhibit of a furnished home for the poor in the interest of the crusade against tuberculosis. Several prizes of a smaller value will be awarded for educational leaflets.

An expedition, sent out by the Russian Imperial Geographical Society, under the leadership of Prof. P. Koslow, will investigate the national characteristics and languages of Central Asia.

The Vienna Akademie der Wissenshaften has granted 25 000 kronen to Dr. Rudolf Poech for an expedition to the Kalahari desert in South Africa, to study the Busamen, who are dying out, and to make phonographic records of their language, and especially of their songs, similar to those made by him in New Guinea.

North Polar problems are treated lucidly by one who is probably the leading authority on the subject, Dr. Fridtjof Nansen, in an address before the Royal Geographical Society published in the *Geographical Journal* for November. The one great problem is, of course, whether land of any great size exists in the unexplored regions. The first thing to be done is by soundings north of the American coast to determine the extent of the deep basin discovered by the Fram expedition, extending northwards through the Norwegian sea. Until such soundings are taken it is almost hopeless to draw any conclusions. Next in importance to this is the tracing of the edge of the great continental shelf which "has only been found in two different places, viz., northwest of the New Siberian Islands and north of Spitzbergen." In dwelling upon the need of a careful study of the sea-currents and the drift of the ice he pays particular attention to the theories of R. A. Harris of our Coast Survey as presented in his paper read at the Washington International Congress on "Evidences of Land Near the North Pole." In some cases Nansen dissents from Mr. Harris's views.

Admiral Sir Francis Leopold McClintock, retired, died in England November 17. He was born in 1819. He was a member of several Arctic expeditions; and in 1859 he found the record of Sir John Franklin's death, and of the discoveries made by Franklin. McClintock later published a report of these events entitled "The Fate of Sir John Franklin, the Voyage of the 'Fox,' 1859."

Prof. Lucien Marcus Underwood of Columbia University, who died by his own hand on November 16, was born at New Woodstock, N. Y., in 1853. After graduation from Syracuse University he taught in various Illinois colleges from 1879 to 1883; and from 1883 to 1891 he was professor of biology at Syracuse. He then went to De Pauw University, Ind., as professor of bot-

any, and in 1895 he resigned to take charge of the department of biology in the Alabama Polytechnic School. One year later he came to the chair of botany at Columbia. He was an authority on the ferns of North America. His observations were incorporated in a series of illustrated quarto volumes entitled "Our Native Ferns and Their Allies," 1904. In addition to this work, he was the author of a "Descriptive Catalogue of North American Hepaticæ" (1884); "Moulds, Mildews, and Mushrooms" (1899); "Our Native Ferns and How to Study Them" (1901). He was a delegate to the International Botanical Congress in Geneva in 1892 and Vienna in 1905; he had been president of the American Botanical Society; and he was a fellow of the American Academy of Science. For some time he edited the *Bulletin*, the oldest botanical publication in America, and the organ of the Torrey Botanical Club.

Drama.

The Collected Works of Henrik Ibsen. Volume V.: Emperor and Galilean. With introduction by William Archer. New York: Charles Scribner's Sons. $1.

The appearance of a new volume containing the two five act dramas that make up "Emperor and Galilean" leaves only two more volumes, the first and the last, for the completion of the new Scribner edition of Ibsen's collected works. Of the shortcomings of these translations we have already spoken in commenting on the earlier volumes.

In his effort to indicate just when and where Ibsen conceived the germ-idea out of which the play grew, Mr. Archer has searched the letters of the playwright painstakingly, but only to miss the truth. He makes Ibsen begin to think of a play on the lines of "Emperor and Galilean" the moment when the first glories of the south's beauty broke upon his vision as he reached the Adriatic. And the choice of Julian as the central figure Mr. Archer traces to the conflict between Pagan and Christian civilization still evident in the ruins of Rome. Ibsen did feel that something new had sprung to life within him when the blue surface of the Adriatic suddenly was spread out before him, as the train left the tunnel at Miramare. But that something was not the idea of a play; rather it was the spirit that gradually came to transform his whole view not only of life, but—what to him was almost of greater importance—of art. And arrived in Rome, it did not happen to him, as Mr. Archer says, that "antiquity sprang to life before his mental vision." On the contrary, the antique and particularly its most typical expression, the sculpture, puzzled and estranged him to begin with. And it did not conquer him until at last he caught its spirit through that marble faun of Praxiteles, which so impressed our own Hawthorne. Then, but only then, did he comprehend sympathetically; and, characteristically enough, it was Greek tragedy that first of all Hellenic modes of expression revealed its full beauty and truth in the clear light of this new understanding. "This indescribably exalted, great, and peaceful joy in the expression of the faces," he writes in a letter from that time; " . . these eyes which at once send their look inward, into themselves, and also right through and far beyond the thing at which they are gazing—such was the Greek tragedy."

Still the thought of Julian the Apostate as the central figure of a monumental drama had not entered his mind. But one day later in the summer of 1864, after he had already left Rome and sought a refuge from the heat in the little mountain village of Genzano, his friend Lorenz Dietrichson, the professor of æsthetics, came to visit him with a book under his arm. The never-resting intellectual curiosity of Ibsen was at once aroused by the bulky volume, which proved to contain the Roman history of Ammianus Marcellinus; and Dietrichson began to tell of what he had just been reading, namely the part relating to Emperor Julian. Then and there Ibsen caught the first glimpse of the play that was to occupy his mind off and on for nine years to come. And throughout all his subsequent reading and dreaming and planning, the determining light on the last champion of dying Paganism continued to come to Ibsen from the pages of Ammianus and from that historian's conception of Julian. (See Lorentz Dietrichson's "Svundue Tider," vol. I., and Ibsen's letter to Roman Woerner of July 7, 1899.) If Mr. Archer had borne these facts in mind, he would not have spent pages of his introduction upon the futile task or picking the historical data of Ibsen's play to pieces. The Norwegian dramatist did not avail himself of the splendid study of the Apostate made by Gaetano Negri, for the sufficient reason that the work in question was not given to the public until some twenty years after the completion of "Emperor and Galilean."

In analyzing the two parts of the play regardless of their historical relations, Mr. Archer properly concludes that between the writing of the first and the second part the playwright had undergone "a decisive change of mental attitude." This change Mr. Archer ascribes chiefly to the impression made on Ibsen by the new Germanic unity that emerged out of the Franco-German war. It explains everything to the English critic except, perhaps, the introduction of the idea of "the third kingdom." Here Mr. Archer is partly right; but he overlooks two factors of as great importance as the one he mentions. The appearance and failure of the Paris Commune made on Ibsen an impression that was fully equal in intensity to the one he received from the flowering of the Pan-Germanic spirit into a tangible form, with a Kaiser and a *Reich*. His exact feelings in this respect are not easily analyzed or described. But the third factor, which Mr. Archer does not even allude to, is the one that seems to shed most light on the unmistakable shifting of the point of view. It was the renewal of interest in Hegelian philosophy which followed Ibsen's removal to Dresden. While living at Christiania from 1857 to 1864, he had had for intimate friends a number of men who were known as ardent Hegelians; but until he made his own home in Germany Ibsen had apparently been satisfied to get his philosophy at second hand. At Dresden, however, while busy with Julian, he was reading Hegel and Schopenhauer more than anything else. Having tried and failed to appreciate the younger Mill, he expressed in a letter to Brandes his contempt for any one who dared to pose as a philosopher without having studied Hegel. And if we accept Professor Höffding's summary of the essence of the Hegelian system as a belief "that the highest must represent a unification of opposites, and that perfection grows out of the conflict between those opposites," then we have the key to Ibsen's idea of the "third kingdom" as well as to the part that idea plays in the later portion of his drama. Although seemingly unaware of the dramatist's familiarity with the triadic theory of Hegel, nevertheless Prof. Josiah Royce of Harvard has recognized and appreciated the true inwardness of the motive running through "Emperor and Galilean," and he has made corresponding allusion to the play in his "Spirit of Modern Philosophy."

In this connection it is interesting to recall that another arch-individualist, Proudhon, the originator of the word Anarchy in its present sense, was also a fervent admirer of Hegel, from whom, avowedly, he took the suggestion for *his* "third kingdom"—that "governmentless federalism" which he regarded as the ideal into which the conflicting interests of the individual and the state should be resolved, but which he finally had to admit was a pure ideal, incapable of materialization in this world.

In preparing an adaptation of his novel, "The Morals of Marcus Ordeyne," for the stage, William J. Locke has been successful in preserving some of the best literary flavors in the book and a condensed study of the hero's character, but little else. Impelled probably by the mistaken idea that there can be no effective drama without "strong situations," he has deliberately changed the course of the original story, complicating it with new motives and incidents until a fresh and attractive, if not very credible, bit of romantic fancy has been changed into unmistakable and rather awkward melodrama, with the usual array of inconceivable coincidences. Naturally these violent scenes are out of place in a setting of literary comedy and help to give the whole representation the appearance of an inartistic patchwork. The flight of the fascinating little heathen, Carlotta, is now no longer the result merely of her own whims and preferences, but of a treacherous plot, conceived by Judith Mainwaring and Pasquale, by which she is convinced that in no other way can the life of Sir Marcus, whom she worships, be saved from her old tyrant, Hamdi Effendi. Thus is the character of Carlotta spared at the expense of that of Judith—one of the brightest ornaments in the original story. For iconoclasm of this sort the cheap applause gained by a few commonplace theatrical surprises does not atone. On the whole, it must be confessed that the play is a disappointment, chiefly because the promise of the opening scenes, written in the spirit of genuine comedy, is so belied in the closing acts. The only character that preserves its original individuality is that of Sir Marcus, played here, in the Criterion Theatre, by the same actor who created it in London, Aubrey Smith. This is an embodiment of artistic verity. The cynical, humorous, kindly gentleman is reproduced to the life, with all the denotements of a frank, simple, tender yet essentially virile temper.

Miss Marie Doro, a young actress, who is still in her novitiate, gives an entertaining but wholly artificial and superficial impersonation of Carlotta.

"Lady Frederick," the new comedy by W. Somerset Maugham, which has just been produced in London, is apparently an almost perfect opposite of his earlier piece, "A Man of Honor." The latter was almost crudely realistic, whereas "Lady Frederick" is utterly artificial, improbable, and even conventional, both in plot and incident. It is also, according to common report, brilliantly written, with wit crackling all through it.

Music.

AN OFFENBACH REVIVAL.

It would be impossible to name two composers more antipodal in their ideals and actions than Offenbach and Wagner, the one a caterer to the lowest taste of the masses, the other an educator to higher things; yet there was a time when these two men were equally hated and abused by the self-appointed guardians of high-class music. This paradox can only be explained by means of another: Wagner and Offenbach were allies! The admirers of old-style opera decried Wagner because he had the audacity to put forward his music drama as a great improvement over that style of opera, which was thus threatened with extermination; and Offenbach they denounced because he parodied and caricatured everything that used to be treated seriously by opera composers and their public. In his "Orphée aux Enfers" and "La Belle Hélène," the gods and heroes of the Greeks, who used to be the stock-in-trade of the librettists, were exposed to ridicule, and in his other operettas nearly everything that people had been in the habit of regarding seriously was subjected to the most cynical caricature, to the great delight of the Parisians in and out of Paris. In the words of Zola.

> This carnival of the gods—Olympus dragged through the mire, a whole religion, a whole age of poetry scoffed at—seemed an exquisite treat. . . . Royalty became a farce, and the army a laughing stock. . . . For a long time the public had not wallowed in more disreputable folly at a theatre. It rested them.

The opera bouffe founded by this buffoon and his allies became so extraordinarily popular that it threatened to swamp the serious grand opera, including the works of that public idol, Meyerbeer, Wagner's pet aversion.

Thus did Offenbach become Wagner's ally as a destroyer of the old order of things. Nor was he a destroyer only. He, too, was a builder, but his structures were flimsy card houses, blown over by a change in the direction of the wind, whereas Wagner built himself temples of art that are now more frequented than ever. Offenbach died in 1880, only two years before Wagner, yet it is rarely that one of his works is now presented on any stage. A few years ago his last work, "Les Contes d'Hoffmann," was revived in Paris, with some alterations, and proved an unexpected success—so great a success, indeed, that several German opera houses repeated the experiment with equally favorable results; and thus it came about that Oscar Hammerstein, last week, presented this same opera at the Manhattan, where it was received as practically a novelty, although it had had, in a somewhat different arrangement, four performances in October, 1882, by a company managed by Maurice Grau. It will probably have more than four hearings this time, for its reception was most cordial.

This does not imply that we are likely to witness a revival of Offenbachism, in the cynical sense of the word. "Les Contes d'Hoffmann" is not one of Offenbach's opera bouffes. Those seem hopelessly abandoned (although some of them, like "Vert-Vert" and the extremely and harmlessly amusing "Princesse de Trébizonde," deserve to be kept alive). They had fallen into neglect even before Offenbach died, and that, probably, was the reason why he wrote the "Contes d'Hoffmann." This he intended as a grand opera which would help him to immortality; and if a quarter of a century means immortality he succeeded. He got Jules Barbier to write him a libretto of which the hero is the German poet Hoffmann, who, in the prologue, relates to a group of students his love affairs with three women, which stories, however, instead of being told, are enacted. To the composition of this score Offenbach devoted the last years of his life, working with the utmost conscientiousness. He succeeded in constructing a work which for the most part resembles real grand opera. The dearth of melodic invention which had begun to manifest itself in his operettas of the seventies, is even more patent here, yet most operagoers are not greatly concerned over a lack of originality in melodies, provided they are smooth and animated and well sung. Mr. Hammerstein's artists, including Dalmores, Renaud, Gilibert, and Zeppilli, did full justice to the music and enacted their rôles with realistic charm.

Young composers in Italy cannot complain, like those of other countries, that there are no opportunities for them. The two leading music publishers of their country have their ears pricked up constantly for new men of promise, and creative effort is encouraged by prizes and in other ways. Sonzogno discovered Mascagni, Leoncavallo, and Giordano, and helped to give their operas European vogue. A later protégé of his is Francesco Cilèa, whose fourth opera, "Adriana Lecouvreur," has won considerable success in Italy. At the Metropolitan Opera House, where it opened the season on Monday, it was a flat failure, notwithstanding the presence in the cast of the beautiful Lina Cavalieri and of Enrico Caruso. At the outset the composer made the mistake of selecting for his libretto a play which contains too much dialogue and offers few opportunities for musical intensification. Puccini has made the same mistake in more than one of his operas, but he saved himself by the gift of writing eloquently for the singers, even when he has little or nothing to say. Cilèa lacks this gift, and his melodic gift also is weaker than Puccini's. He gave Caruso no opportunity to arouse enthusiasm. It will be a blessing if this fiasco should help to check the tendency at the Metropolitan of selecting inferior Italian operas in the hope of their being floated by that tenor's popularity, instead of urging him to master a higher class of operatic rôles, such as Jean de Reszke, a much greater artist than Caruso, used to impersonate.

A year ago most musicians, if asked who was the greatest living violinist, would probably have answered "Joachim." But Joachim was a very old man when he died, and if he ever deserved that epithet it was only from the intellectual point of view. Sensuous beauty of tone and emotional warmth were never his conspicuously. Of the violinists now before the public the one who most successfully embodies the intellectual, sensuous, and emotional qualities is Fritz Kreisler. He can also display a Paganinian virtuosity quite equal to Kubelik's, but fortunately he does not make a point of setting off such fireworks. His specialty is the exhuming of eighteenth-century musical gems and giving them a modern musical setting. At his Carnegie Hall recital last week, he thus delighted a large audience with forgotten pieces by Martini, Francœur, Couperin, and Porpora; he also played, with nearly flawless art, sonatas by Handel and Bach, and some modern pieces by Dvorák, Wieniawski, and Paganini in a way to convince many that he is the greatest living violinist.

Eugen D'Albert recently celebrated the twenty-fifth anniversary of his first public appearance as pianist. He was born in Glasgow, studied with Liszt, and has become an out-and-out German. After writing a number of unsuccessful operas, he has at last won success with his "Tiefland." In Berlin, Cologne, and Frankfort this opera has been so much applauded that a number of other theatres have put it into rehearsal.

Horatio Richmond Palmer, a veteran teacher of music, composer, and editor, died on November 15 at Yonkers, N. Y. He was born in 1834. Not long after the Civil War he settled in Chicago, where he edited a monthly journal, the *Concordia*, prepared text-books, and conducted singing festivals. His work spread over the Northern States, and even into some of the Canadian provinces. In 1881 he assumed charge of the Church Choral Union of New York city, where he was very successful. Similar organizations under his leadership sprang up in Brooklyn, Buffalo, Washington, Philadelphia, and other cities. He also had charge of the Chautauqua musical work. His text-books and song collections have been widely used in this country. His first books, "The Song Queen" and "The Song King," were published in 1871. He was also the author of several theoretical works, among them, "Theory of Music," "Class Method," "Dictionary of Musical Terms," and "Manual for Teachers."

Art.

AUSTRALIAN LANDSCAPE PAINTING.

SYDNEY, October 1.

So recently as twenty-five years ago a New Zealand merchant, intending a compliment, sent some colonial paintings to business correspondents in London, and the verdict of English connoisseurs was that they had almost every technical fault a picture could have. It was not to be wondered at. Art in Australia is pursued under difficulties. Even were there artists in

numbers, taste to appreciate, and money to buy their pictures, artists lack both exemplars and models. Many costly purchases have been made, but only a few of the greater painters and none of the older masters are yet represented in Australian galleries. The Australian artist, like the American artist till lately, must go to school in Europe, and too often, like the American artist, he remains there.

Australia has a worse fault than the lack of great paintings; it is not a picturesque country. Set aside Sydney, sitting like a queen overlooking her twin harbors, her two romantic rivers, and her rugged coast line; set aside Adelaide, the Victorian snow-clad ranges, the maimed grandeur of the Blue Mountains in New South Wales, and the windings of the Hawkesbury River, and beauty-spots are rare in Australia. Even little Tasmania is richer in them; and New Zealand abounds in the picturesque and the magnificent. Nature in Australia is unfriendly to painters. Human nature is hardly more friendly. One of the finest landscapes yet produced in Australia was lately presented to the national collection of New South Wales. The accomplished artist asked only 150 guineas for a large canvas that must have cost him months of toil, but was fain to content himself provisionally with one-half of that modest sum, which was all that could be raised at the time. After four weeks' exhibition of the paintings for the year, the members of the Royal Art Society were pleased at having sold pictures to the value of $2,000. Yet Sydney is enjoying unparalleled prosperity.

Some of the more headlong members of the Royal Society lately broke away from it and founded a new academy. They have weakened the old academy, and they have scarcely strength enough to stand by themselves. Much that was best in the older institutions has still been left; its landscapes remain. These are the glory of the new Australian school, as its members fondly dub it—perhaps more prophetically than historically. What are its æsthetic characteristics?

One is preëminent. The embryo school is differentiated from other schools by its "vivid rendering of light," says a well-known Sydney artist, A. J. Daplyn, in a practical manual of Australian landscape painting published in 1902. No picture better illustrates the dictum than the striking landscape already alluded to, exhibited last year by W. Lister Lister, president of the Royal Art Society. The Golden Splendor of the Bush, best known by the omission of the pleonastic epithet, is perhaps the most distinctive and distinguished of Australian landscape paintings. Compared with English landscapes, it is simplicity itself. Every climatic region has its typical forest. The difference between flora geographically so closely related as the forests of New Zealand and Australia is very striking. Sixty years ago Missionary Ellis truthfully described the tangled undergrowth and the thickly interwoven foliage of the New Zealand bush, and both features remain. So dense is the forest in consequence that, as in the fragment still left in Sir George Grey's romantic island of Kawau, the wanderer is seized, like the old Roman, with a religious awe. Quite different is the Australian forest as seen in Mr. Lister's brilliant paintings. Giant gum-trees shoot up straight to the sky, dropping their foliage as they ascend, so that the mid-space is clear, nor is there the tangled undergrowth of the New Zealand bush. Thus, the bright sunshine strikes irresistibly into all parts of it, and lights it up almost pitilessly. In the Splendor of the Bush the sunshine is so vivid that the spectator involuntarily looks up to see if a gleam has not fallen on the picture through the plate-glass of the roof. The effect is similar, though less startling, in the companion picture, the Wealth of the Bush, hung in this year's exhibition. In this effulgent air the artist can paint all day in the open. He need not, like painters in other countries, make hasty sketches out of doors and paint them in his studio; he can finish his painting "under the splendid sky." His pictures gain by it. The coloring is light and fine, and the tones fresh. Where, as in certain pictures that have received a permanent place in the Art Gallery of Sydney, the coloring is rich and dark, and the general effect heavy, we may assume that European traditions have distorted the artist's perceptions and perverted his style. They are not truly Australian pictures.

We must also allow that, from the artistic point of view, the climate has its drawbacks. J. A. Symonds tells how, when the sun has poured a full flood of light into a Swiss valley, "every atom of craggy outline, every Alpine slope of grass, and all the interminable depths of pine forests . . . are brought into intense relief." "Clear, uniform sunlight fatigues me," he continues; "it makes nature dead." So is the Australian sunshine too pitiless. It lights up everything, leaving nothing in shadow, and baring the nakedness of the trees and the poverty of the bush.

The mountains of Australia are as unique as its forests. Without peaks and (save in their interior, where they break into myriad glens and gullies) without declivities—steep, hardly accessible, with precipitous sides and plateaued summits—they appear to offer few prospects to the artist, and teachers warn tyros away from them. Outward beauty the Blue Mountains have none, but away deep-hidden in their dells the traveller finds ravishing scenes. Some of these have been found by Mr. Salvana, who adorned the late exhibition with charming pictures, somewhat faintly colored. But there is grandeur as well as grace, and Mr. Piquenit has gone to where it was to be found. He has truly seen and strongly felt the massive rocky sides of Mount Kosciusko, with the clouds hanging like misty veils over the rugged shoulders. He has seen them as the mighty vertebræ of Australia; immovable strength and everlasting endurance are his reading of those awe-inspiring rocky masses.

Mr. Lister and Mr. Piquenit have both painted the sea. When Mr. Piquenit paints "A Southern Headland" in Tasmania, he shows the resisting strength of the rocks beaten by a furious sea. Mr. Lister's water is tame in comparison, but it is various, and it is luminous. The lemon yellows predominate in many recent pictures, such as Mr. Bennett's When the Heart is Young. It is partly that the bright sunlight floods everything and turns it all to gold; partly that in such pictures as Mr. Daplyn's, A Corner of Our Selection, there are hedgerows of yellow shrubs and wildflowers with bright yellow blossoms; partly that the prodigally scented wattle, acclaimed by a succession of poets as the national flower of the "Britain of the South"—

> Our Danaë-tree, that blossoms in rains of gold—

fills the foreground and gives the landscape its distinctive hue. And in the distant background there are often purples that recall the heathery hillsides of Arran in August.

But it is premature to classify a style that is at the antipodes of some of the Dutch schools and is perhaps most closely allied, in spirit and manner, with modern Impressionism. In Mr. Daplyn's little volume (issued by Penfold of Sydney) are skilfully reproduced two of his own best pictures, while six others illustrate the various styles of the president of the Royal Art Society. J. C.

Under the cautious title "Un Raphael Méconnu au Musée Poldi-Pezzoli de Milan?" the usually conservative *Rassegna d'Arte* presents something of a sensation. The writer, M. E. Durand-Gréville, has discovered nothing less than a formula by which Raphael's painting in the studio of Perugino may be distinguished from that of the master. When we find a Perugino in which the lights of the flesh are loaded, crosshatched, and subsequently fused, we may infer that, though the design may be Perugino's, the actual painting is Raphael's. So far M. Durand-Gréville has added to the list of the Urbinate only the beautiful Madonna with Six Donors in the Perugian Pinacoteca, and the inferior variant in the Poldi-Pezzoli. But many other Raphaels have been rediscovered and will be revealed unless meanwhile the critic be dissuaded. The matter is evidently too large to be dispatched in a note, but we may at least hint at the wide gap between such evidence and demonstration. What about Raphael's studio mates, who presumably copied his innovations about as fast as he invented? We know that this was the attitude of Spagna and Manni. As for the Milanese Madonna, unless the photograph be wholly deceiving, it is a school piece of no especial quality, possibly a Spagna. It might well be left as an anonymous derivative of the Perugian masterpiece. In the same number Francesco Malaguzzi-Valeri continues his valuable studies of Minor Lombard Painters. In particular he claims with plausibility for Giovanni Donato da Montorfano, whose crucifixion faces the Last Supper of Leonardo, a large part in Romanizing the art of Milan. In this he must be regarded as an influence parallel with that of Bramante.

Signor Canizzaro offers in the *Bollettino d'Arte* for October an elaborate reconstruction of the Arae Pacis Augustae. His theory, based largely on the exact location of the finds, differs somewhat from that of Petersen. The article is fully illustrated. Dr. Frizzoni reports the successful cleaning and restoration of the great Cima of Casiglio, in the Brera. This fine picture was rejected by that museum as late as 1851, and recalled in a deplorable condition only a few years ago. The Galleria Nazionale at Rome has arranged an exhibition of old landscapes, including examples by Bril, Tassi, Swanevelt, Berchem, Pan-

nini, Hackert, Charles Vernet, with two recently acquired sketches by Salvator Rosa. In general the sentimental landscape of the seventeenth and eighteenth centuries is represented, with the great lacuna of Claude. Among the damages caused by the earthquake in Calabria, must be counted as chief the destruction of the cathedral of Gerace Marina. It was the last survivor of the numerous churches in the territory of Aspromonte, which were founded by Robert Guiscard.

The Amtliche Berichte from the different collections in the Berlin Museums, which so far have been published only quarterly as a supplement to the Jahrbuch der königlichen-preussischen Kunstsammlungen (Berlin: G. Grote), are now to appear monthly in an altogether new form. The former reports were not illustrated, and consisted almost exclusively of a catalogue of additions to the collections. The new reports are to be fully illustrated with pictures of recent acquisitions; and these illustrations are to be accompanied by brief descriptions from reputable authorities.

At the annual meeting of the subscribers to the British School of Archæology at Athens, held in London October 29, the director, R. M. Dawkins, gave an account of the season's excavations. The chief task had been the exploration of the Sanctuary of Artemis Orthia at Sparta. The Roman theatre (the "Circus" seen by Leake in 1830) has been completely excavated, and the general plan, with the various entrances and steps leading to the seats, reconstructed from the remains. This theatre, dating from the third century A. D., was built to accommodate the spectators who came in great numbers to view the contests held in honor of Artemis Orthia. The interior of the temple was cleared down to solid earth, with the result that three different strata could be distinguished. At the top was the Roman stratum, in which stood a Roman altar. Immediately below this was discovered a Hellenistic stratum containing various remains and ashes, and also a Hellenistic altar. The lowest stratum was a metre thick, and contained a large altar made of roughly-dressed stones, in a good state of preservation. Near the altar were found charred remains, and a fragment of cobble pavement The rest of this stratum consisted of a mass of objects, all of an early period. Thus, the altar and the cobble pavement must be dated between the seventh and ninth century B. C. Traces of the temple belonging to this period have not yet been discovered. The temple of which remains have been found should probably be assigned to the middle of the sixth century B. C.; to it, perhaps, belongs a fragment of a lion's head, brightly painted, and other scanty remains of archaic sculpture. Another interesting discovery was the Sanctuary of Athena Chalkioikos, or Athena of the Brazen House. We know from literary evidence that "the brazen house of Athena" on the Acropolis of Sparta was a temple coated with bronze plates, in which Gitiades had fashioned the deeds of the gods and heroes; also, that the *temenos* where the brazen house stood was surrounded by a colonnade and included other sanctuaries (Paus., iii. 17). It was within this *temenos* that Pausanias of Sparta took refuge as a suppliant, and was there starved to death. This famous sanctuary has been identified beyond doubt by the discovery of several roof-tiles with the stamp Ἀθηνᾶς χαλκιοίκου (of Athena Chalkioikos). In addition to the work done at Sparta, an important find was made in Thessaly, on the supposed site of a Greek temple. Here four "geometric" tombs were discovered, containing skeletons, brooches, rings, iron pins with bronze heads, and eighteen vases. The floor mosaic of a church of the fourth or fifth century and two Byzantine columns were also found.

The French School of Athens announces the discovery at Delos of a hypostyle hall, the largest and highest of the buildings yet found. It has a ground surface of more than 1,840 square metres, and its long façade presented a Doric portico to the Sacred Port. The inside agora was a forest of columns, nine rows by five. Around the hall was a row in the Doric order; then another, also Doric, but higher; finally, the entire central part was raised. This was a direct forerunner of the Roman basilica and shows an architectural type unknown to classic Greece, with its origin still to be sought in the East. The building has been dated from the year 111 before Christ; it is not yet entirely excavated.

F. A. Bridgman has held an October exhibition of his collective art work in Paris. It is just thirty years since he won his first honors at the Paris Salon, and it is nearly forty years since he came to study under Gérôme. All this time he has been typically a "Paris American" artist, but his range has been wide. In America he is probably best known as an Orientalist, by which is really meant a painter of Egypt and Algiers. As such he gained his first reputation, which he has never surpassed. Still, the 250 paintings and 50 pastels of this exhibition must have been a revelation to his fellow-countrymen. The Oriental (North African) subjects have a sentimental and decorative look which, in the hurrying march of late years, is old-fashioned enough to be almost new; they are certainly refreshing after recent violences. Whatever their relative excellence, these paintings are art works and not natural history illustrations. But there are also Swiss landscapes, carnival scenes, and bullfights of the Midi, and a deal of purely decorative figure work. This is not surprising from an artist who, with such an unusually full product, has found time to publish poems, travels, and art controversy, not to speak of a musical symphony executed in part this year by the Vichy orchestra. Mr. Bridgman was born at Tuskegee, Alabama. At seventeen he was working at designing and engraving with the American Bank Note Company, but soon after went to Paris, where he was almost at once received at the Salon (1868). Since that remote time he has scarcely missed an annual Salon, presenting Breton scenes until 1873, when he began his Orientalism. This he continued until 1880 since which time he has made intermittent excursions into Classic and western European fields and portraiture. He has been greatly honored in France, and is an officer of the Legion of Honor.

Frederick Stymetz Lamb has designed eight windows for Plymouth Church, Brooklyn, Henry Ward Beecher's old church, which have almost been completed. They will be placed in memory of prominent deceased members of the congregation and will be dedicated on Founders' Day in December. The subjects are: Hampden and Pym speaking before Charles I. for the Bill of Rights; Milton writing the "Plea for the Liberty of the Press"; Oliver Cromwell announcing to George Fox freedom of worship; the departure of the Pilgrims from Delfthaven on the Speedwell; the signing of the Compact on board the Mayflower; the landing of the Pilgrims at Plymouth; the founding of Harvard College; and John Eliot preaching to the Indians.

Among the exhibitions at the dealers' shops in this city may be seen a collection of paintings by Dutch masters at Scott & Fowles's, open till November 23; pastels by Sutton Palmer, Arthur Tooth & Sons, November 30; eighteenth century prints of women and children, K. J. Collins's, November 30; mezzotints by Fred Miller, J. H. Straus's, November 30; paintings by Hugh H. Breckenridge of the Pennsylvania Academy of Fine Arts, Fishel, Adler & Schwartz's, November 30; engraved portraits of painters and engravers from the fifteenth century to the present day, W. K. O'Brien & Co.

On December 10, 11, and 12, Frederick Müller & Co. of Amsterdam sell a large collection of prints, 1,032 lots, comprising portraits, early woodcuts, etchings by Rembrandt, some being fine proofs. Among them may be noted the second state of Christ Healing the Sick, known as the "Hundred Guilder Piece," and the Good Samaritan, proof in the first state.

Charles Petre, keeper of the museum at Bourges, has just died in his seventy-ninth year. As a sculptor, he is known for his statue of Marshal Ney at Metz.

Finance.

HOW MUCH MONEY HAS BEEN HOARDED?

A member of the Cabinet was quoted a week ago as saying that $1,500,000,000 currency is being hoarded by American bank depositors. Probably he never made such an estimate, for the figures are absurd. The entire cash holdings of this country's 6,500 national banks, at the time of their last reports, was $704,000,000; and the latest estimate, by the comptroller of the currency, gives $334,900,000 as the total cash holdings of the country's State banks, savings banks, private banks, and trust companies. Therefore any such figure as is named above for the actual hoarding, due to panic, cannot be seriously considered. The actual amount is not easy to estimate. The net cash loss of the New York Associated Banks, shown in their statements of the three weeks ending November 9, was $47,800,000, and this notwithstanding deposit of $41,000,000 by the Treasury and delivery of some $10,000,000 foreign gold which probably affected last Saturday's bank statement. This would mean, apparently, a gross loss of nearly $99,000,000 cash at New York alone.

But, for all of this sum the money-hoarders can by no means be held responsible. In the same three weeks a year ago, when no one was hoarding, cash in the New York Associated Banks decreased $14,000,000—

this notwithstanding addition of $10,000,000 through gold imports. That outgo was due to the normal autumn needs of the harvest States. With this year's belated harvest, a much greater sum would naturally have gone out from New York, in those three weeks; but besides this, New York banks had to provide cash for out-of-town banks facing a credit crisis of their own. The weekly unofficial statements of total cash, shipped from our banks to the interior in that three-week period, foot up to $35,000,000. Deduction of this from the $99,000,000 given above would leave $64,000,000, of which perhaps the greater part, in one way or another, has been hoarded.

Hoarding in other cities is more difficult to calculate. Taking the national bank reports as a criterion, New York holds 30 per cent. of the actual cash reserve and the rest of the country 70 per cent. If the rush of hoarders had been in the same proportions elsewhere as here, one might reckon that outside of New York, $187,000,000 had been thus removed from the usual channels. But it must not be forgotten that it was here that the prolonged bank run converged, and here that the Treasury during four days poured its surplus cash through the banks into the trust companies, by whom it was paid out to possible hoarding depositors. No comparable disbursement of cash was made at any other point. Boston banks, for instance, showed in their public reports a decrease in cash holdings of only $2,500,000 in the same three weeks, and the loss at Philadelphia was $9,700,000.

These are large cities; if their small losses, compared with the $47,800,000 reported by New York, is fairly representative of conditions throughout the country, then the maximum amount hoarded in the United States was probably not more than $100,000,000. Following the same process of estimate for 1893, we should infer that something like $35,000,000 was then hoarded at New York, and possibly $50,000,000 in the country as a whole.

Necessarily, these estimates, or any estimates in so obscure and complicated a movement, must be taken with much reserve. Large allowance must be made for banks, throughout the country, which are carrying larger cash reserves than usual for the very reason that they fear a run and cannot rely on getting cash in sufficient quantity from their city depositories. The natural tendency—on the part of people who are not, strictly speaking, hoarding at all—to carry more than usual in their pockets, must also be taken into account.

BOOKS OF THE WEEK.

Adams, Joseph H. Harper's Electricity Book for Boys. Harper's. $1.50.
Atherton, Gertrude and others. The Spinners' Book of Fiction. Paul Elder & Co. $2 net.

A fascinating biography

G. S. Layard's

Shirley Brooks of "Punch"

His Life, Letters, and Diaries. 590 pp., with initial letters and 8 illustrations, gilt top, $3.50 net.

H. H. Spielmann called Shirley Brooks "perhaps the most brilliant and useful all-around man who ever wrote for *Punch*," and the celebrated Mark Lemon, *Punch's* first editor, declared "Shirley's pen is the gracefullest in London." He was one of the last of the great letter writers. His diary is full of intimate human bits as well as interesting side lights on world-famous people, and his biography full of his brilliant remarks. The London world of the sixties and early seventies lives again in these pages.

HENRY HOLT & CO 29 W. 23d St. NEW YORK

A document written in lead pencil on flimsy paper is valid in court—if it lasts to get there.

Ink and OLD HAMPSHIRE BOND are permanent.

OLD AMPSHIRE BOND

"Look for the Water Mark"

is paper to which you can intrust your most important permanent documents.

You should have the *Book of Specimens*, which shows OLD HAMPSHIRE BOND in white and fourteen colors, made up into letterheads and other business forms as actually used by prominent houses. *Write us on your letterhead.*

Hampshire Paper Company

The only paper makers in the world making bond paper exclusively.

SOUTH HADLEY FALLS, MASS.

We Want Your Wants

Our facilities for locating *rare and out-of-print books* are probably unexcelled. Whether it is worth thirty cents or hundreds of dollars we'd like to know that you want it. You will incur no expense and create no obligation by asking us to look for it for you, and we will try to quote you within a short time.

And we should like to have your name on our mailing list. We will send interesting catalogues as issued which no collector can afford not to have regularly.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 28, 1907.

The Week.

"I don't think any man who has the welfare of the country at heart should criticise their [the President and the Secretary of the Treasury] action adversely." Thus spake Representative Mann of Illinois in Washington on Monday. A similar sentiment was expressed by Mr. Hull of Iowa: "I believe in holding up the hands of the Administration in times like these." The point of reference of both these gentlemen was the statement of Congressman Fowler, urging both legal and economic objections to the issue of $150,000,000 interest-bearing obligations, at a time when the Treasury has a large surplus. No one has questioned the soundness of his argument. To denounce it as "inopportune" has been thought sufficient. His logic is not impugned, but his patriotism is doubted. But should an instructed and public-spirited man hold his peace when he sees the government making a serious mistake? It is said that in a time of depression like this, every effort made to relieve it, even if blundering, should be generally backed up, or at least that those who cannot approve it should keep silent. But is it or is it not patriotic to do one's best to make the Treasury operations both sound and helpful? This question answers itself. The result of the discussion has been distinctly wholesome. Secretary Cortelyou has discovered, though a little late, that the troubles with the currency are rapidly mending without his 3 per cent. certificates, and so he proposes to cut down their issue to the smallest possible limits. This again would be a complete justification of the fault-finding. Far from being "inopportune," it was especially timely. There cannot be two minds about the duty of the press to be calm and cautious in such a crisis. But this does not at all mean that it should abdicate its judgment. It is the part of a self-respecting newspaper, as truly as it is that of a conscientious public man, to utter freely what it believes to be the truth, even if it take the form of criticism of official measures. There are various kinds of hysteria to be opposed—the hysteria of unreasoning panic, and also the hysteria of demanding that every plan to stop the panic be hailed as divinely inspired. The latter may be as harmful as the former. The more confused and perilous the situation, the greater the need for those who have a firm grasp of both facts and principles, and who can see their way, to put their knowledge at the service of their fellows. The time when banks are suspending cash payments is the poorest of all times for newspapers and economists and informed men in office to suspend the exercise of their reason.

Mr. Bryan has now come out with *his* plan to restore confidence and stop hoarding. It is simple, in both senses of the word. He would merely have the government guarantee the deposits in national banks. Then if everybody knew the funds were safe, nobody would want to draw them out. This leaves out, of course, private banks, State banks, and trust companies, but Mr. Bryan is confident that he could devise some way to guarantee their deposits, too. His proposals are undoubtedly excellent, as far as they go, but they do not reach the root of the trouble. The government guarantee really needed is one against business failure of any kind. Let an act of Congress be passed guaranteeing that every mining and manufacturing enterprise, every railroad company, every business venture, shall make at least 6 per cent. on the capital invested, and it is evident that doubt and depression would at once end. It is not often that we have to criticise Mr. Bryan for being over-conservative, but his plan for use of the government as guarantor is evidently too timid. While about it, let us make a clean sweep of it, guarantee everybody everything, and then confidence and well-being will be in widest commonalty spread.

That was a happy phrase which the three hundred Alabama Democrats employed at Birmingham in their address to voters, urging that the next Democratic nomination should not "go by default to William J. Bryan." What proportion of enthusiasm and what proportion of mere resignation are mixed, we wonder, to produce that Bryan sentiment which Congressman Sulzer on his recent trip found so pervasive? At some times and in some parties a nomination by default may be thought a normal and healthy settlement. For the Democracy of 1908, such a result ought not to be even considered. To begin with, every week enhances the value of next year's Opposition nomination. Men who six months ago would have scouted the notion that the end of the Republican national control was in sight, talk calmly now of the possibility of a Democratic successor to Mr. Roosevelt. That very fact makes it doubly important that if Mr. Bryan is to be nominated for a third time, it be only on the most convincing demonstration that he is the first choice of Democrats. This is a time for inviting the most critical and searching comparison between Bryan and the other "possibilities." Not in a long time have the conditions been so propitious for winning votes from the other side; but this does not mean that such votes will come over automatically. The most fanatical devotion of the thick-and-thin Democrats cannot prevent defeat unless their candidate can also make inroads into the enemy's country. The South, as the Nashville *American* puts it, is "the custodian of the Democratic party." We are glad, therefore, to see that Southerners are beginning to take the lead in the serious consideration of other candidates than Mr. Bryan.

The speeches at Faneuil Hall Monday night demonstrated once more how many different lines of reasoning lead naturally to the conclusion that we should withdraw from the Philippines. "If we didn't have in our keeping the sovereignty of the Philippines," said Congressman Slayden of Texas, "there would be no more danger of trouble between the United States and Japan than there is of an armed conflict between this country and the Swiss Republic." "My own conviction," said Judge Blount, after six years in the islands, "is that, if we are going to colonize at all, we should do so with the brutal honesty of the British; that at present we are throwing away all the previous experience of mankind." "Independence," said Congressman McCall of Massachusetts, "is beyond question the almost unanimous desire of the people of the Philippine Islands. It has been expressed in a national poetry which this country would find it difficult to match. . . . Neutralization will be a step toward the solution of the question, in accordance with our own interests and those of the Philippines, and in the interests, too, of the peace of the world." In the neutralization plan, for which all these men spoke, the anti-Imperialists offer not mere opposition to accomplished work, but a constructive policy based on successful historical precedent. This is the ninth year of American occupation. Since our flag went up there has hardly been an important event affecting the Philippine question, either here or there, that has not strengthened the case for independence. The Imperialist at home has changed from a Jingo to an apologist; while in the Islands many of the successes of administration go to prove the capacity of the natives for working out their own destiny. Originally a very unpopular cause, anti-Imperialism has, within a remarkably short period, been strikingly vindicated.

It is a remarkable circumstance that

the only militant civil-service reformer who ever sat in the Presidential chair has disposed of offices in more variegated ways and for more variegated reasons than any of his predecessors. On Monday he made the two South Dakota Senators draw cuts for seventeen Federal appointments—land agents, Indian agents, marshal, and bank examiner. His last previous plan for settling such an obstinate squabble about patronage, we may recall, was to set the Iowa delegation in the House of Representatives balloting on the question of a Federal judgeship, and while they were thus engaged, appoint the man he personally preferred. The great principle that the President should not be compelled to decide questions of fitness is making excellent headway. A similar doctrine has likewise been applied with much success in the matter of removals Thus we had the chief and his assistant removed from the Ellis Island immigrant station on the ground that they could not get along together. Similarly, the colored battalion had to be discharged dishonorably because the task of finding out which members were innocent and which, if any, were guilty was quite beyond the government's powers.

Ex-Senator Spooner's speech at the Chamber of Commerce dinner in this city last Thursday night was a protest against unsettling theories of Constitutional interpretation, against rash action by Legislatures, not looking before they leap, and against ill-considered attempts to put the business of the country in a strait jacket, to be loosened or tightened at the whim of somebody temporarily in power at Washington. It is, however, not so much the substance of Mr. Spooner's deliverance, as the fact that he made it at all, which seems to us noteworthy. He appears to be enjoying a new liberty—a liberty which he purchased at the great price of resigning from the Senate. As a Senator, he too often bore himself as a man that was fettered; bound by party obligations. We do not forget that Senator Spooner sometimes displayed independence. He voted against Hawaiian annexation. He opposed the ship-subsidy bill. Even when he felt compelled to support the President, he expressed dissent in details. Thus he clearly intimated his opinion that Mr. Roosevelt's celebrated "fifty-mile" order at Panama was wholly illegal. And in defending the President's action in the matter of the dismissal of the colored troops, he stated that a part of the Roosevelt ruling was absolutely unwarranted by law, and must be rescinded—as it was. But these were the exceptions. In general, Mr. Spooner bad almost the official position of defender of his party and of the President. If active members were free to give their unbiassed opinions, it would do much to heighten public respect for the upper house. The shackles of party have long had a cramping influence upon the Senate. Whenever it is temporarily freed from them, its latent powers, and its inherent usefulness to the country, at once appear. There was such a period during the first years of Mr. Cleveland's first Presidency. The majority of the Senate was then Republican. The result was that the measures of the Administration were subjected to a searching criticism which was valuable, even when it was partisan in motive. With men like Edmunds and Spooner and Hoar to seek out the joints in the President's harness, and with a Senate that could not be whipped into line by party, nor coerced by Presidential patronage, public measures got a wholesome discussion. We will just add that the prospect of a recurrence of such conditions would reconcile many to the election of a Democratic President next year. The Senate would be politically hostile to him, probably for his entire term. This would make it impossible for foolish laws to be rashly passed, and it would also restore the Senate to the function of independent criticism.

Conscription as a possible remedy for the steady depletion of our army ranks is suggested in the annual report of Adjt.-Gen. Ainsworth to the Secretary of War. We are not greatly alarmed by this sudden spectre of compulsory service. We take it only as an indication of the habit that is growing in Washington of announcing heroic remedies for temporary ills. It is as if the head of a household whose cook threatens to leave were advised either to divorce his wife and go live at a hotel, or else raise Bridget's wages three dollars a month. Why not increase the soldier's pay, if the competition in the labor market is such as to make enlistment at the present rate of remuneration impossible? That the recruiting officer must compete against the employer of labor, is generally recognized; the fact receives confirmation at the present moment, when temporary business depression is reported to have led to an increase of 100 per cent. in the number of applicants at the Philadelphia naval recruiting station. If the stand-patter has made wages high for the American workman, why should he refuse the same blessing to the man in the army? A prosperous country can afford to be generous to its defenders. Protection, so its defenders assert, hath given in the form of increased wages. Why may it not take in the form of increased taxation?

That the outward bound steerage traffic, in spite of an increase in rates, is 60 per cent. larger this year than is normal for this season, is one symptom of present industrial conditions in this country. But it has an equally important bearing on the larger problem of our immigration. That these foreign-born workmen are so little assimilated that they quit the country the moment it ceases to pay them to remain, may be the restrictionist's interpretation of the present exodus. Yet it is an answer at the same time to the charge that the foreigners keep on coming to our shores whether there is work for them or not. Their readiness to recross the ocean is one more illustration of the immigrant's understanding of the labor market. It is something to the credit of his intelligence and foresight that he will seek work in his native country rather than run the risk of dependence here. The point is that, if we concede him those qualities when he leaves our shores, we cannot deny them to him when he comes. The advocates of the further restriction of immigration will doubtless renew their efforts at the coming session of Congress; but in the present demonstration of the workings of natural and automatic checks on the supply of alien labor, we have an argument for legislators to consider seriously.

There are many analogies, practical rather than legal, between the relationship of the State to the nation and that of the city or village to the State. As the issue of centralization in national affairs has suddenly assumed new importance, it is an opportune time to examine the growth of centralization in the States themselves. Gov. Hughes, urging before the Civic Forum the great importance of full responsibility and accountability for local officials, touched on some of the same lines as Secretary Root, who in his much-discussed speech of last December pointed out that the full and competent exercise of their powers by the States is their surest defence against Federal encroachment. One obvious distinction, however, is the comparative helplessness of the cities and lesser divisions in their claims to distinct powers and duties. Jealous enough of their own rights as against the Federal authority, the States have been very arbitrary in giving and taking away the rights of the separate communities within their borders. A general impression that our larger political units are more efficient than our smaller has probably strengthened the centralizing tendencies. "Our city governments are less competent than our State governments," the "practical" citizen often says, "while our State governments in their turn are less competent than the national government. What harm, then, if, when a particular job needs to be done well, we turn it over to the officials who have the best records." But while the transfer of a particular function from the State to the Federal

government encounters many legal and sentimental difficulties, a similar transfer from the city to the State has often been perfectly easy, often accomplished by a boss's nod. So we have had State laws without number in reference to purely local affairs, State officials with purely local functions, and a generally paternalistic attitude on the part of our State governments. Before the local communities can rise to that new efficiency which those who think with Gov. Hughes desire for them, the States must do their part by striking off the fetters of needless and hampering legislation. An encouraging tendency in this direction has already set in. State constabulary bills do not appear with their old-time regularity in the Legislatures. Better still, the cities, in the West especially, are gradually gaining the right to make and amend their own charters, as the States do their Constitutions. The adoption of that policy generally means a long step towards that real local autonomy which is on so many accounts to be desired.

A new electoral law for Cuba is announced as ready for promulgation. The present intention is to hold municipal elections next spring, and the Presidential election in the following December. Yet a tone of hesitancy, suggestive of discouragement, characterizes the attitude of the Administration towards Cuba. This proceeds, it seems to us, from the failure to recognize the limitations under which this country's problem in Cuba must be worked out. That the government of the island, when surrendered to the natives, will not be up to the standard of efficiency set up by the present American administrators, is probable. That party spirit will once more grow ebullient, that parliamentarism in the sense in which English-speaking communities understand the term, will not develop in a day, is equally probable. But is it not just as well to recognize at the beginning that a Latin-American republic cannot be remade in conformity with our conception of an ideal republican government, and that to the Latin-American mind the political virtues and vices are not ranked exactly as with us. It is the duty of the American officials in Cuba—a duty which they have been faithfully fulfilling—to set the machinery of the republic in motion again, with all possible precautions against misuse by the less capable hands to which it is entrusted.

Count Okuma, leader of the Japanese Progressives, is the *enfant terrible* of the Mikado's household. No Japanese bosom can cherish in secret an ambition or a vague resentment without Okuma's blabbing at the international dinner table. Only a few months ago the Count was furiously berating Uncle Sam, Japan's first Western friend. The other day he made England furious by remarking that Japan would be failing in her duty to herself if she did not come to the aid of India's oppressed millions who were calling for help against European oppression. It follows, on the other hand, that, if Count Okuma, as the unofficial barometer of domestic conditions, has pleasant things to say about anybody, Japan as a whole must be feeling in amiable mood. When the Japanese government declares that Japan, as a peace-loving nation, is ready to restrict emigration among its subjects rather than endanger its pacific relations with the United States and Canada, the skeptic and the jingo may continue to cherish doubts. But when even Count Okuma states that, in his opinion, the Japanese government "should assist America at a time when prejudice as well as political and economic conditions rendered the emigration of Japanese to that country inexpedient," the chances of our picking a war over the immigration question become very slim indeed.

In connection with the entire subject of Asiatic emigration, something crops up in the news, now and then, of the field for Japanese settlement that is to be found in Mexico and South America. A correspondent of the Paris *Journal des Débats*, writing from Rio de Janeiro, speaks of "the decision of the State government of Rio, arrived at a few days ago, to distribute lands among Japanese immigrants." He then proceeds to point out that such action is in conformity with the new colonization policy that is being carried on by the States with the aid of the Federal government. Immigration has always been encouraged, but until recently the main object was to secure an adequate supply of labor for the great plantations. Of settlement, in a real sense, there was little; there were, rather, huge encampments of foreign agriculturists who migrated from hacienda to hacienda, according to the fluctuations of the labor market, which, in turn, was subjected to great variations of over- and under-supply. The immigration law of 1907 provides for a continuance of government aid to immigrants, but only to those who are ready to take up government land in some settlement. The colony system is intended to supplement the plantation. The purpose is nothing less than to create a rural middle class between the field laborers and the owners of haciendas.

Sir Henry Campbell-Bannerman's illness makes the reconstruction of the British Cabinet a near possibility. Should the veteran Liberal leader decide to lay down the burden, the party would not be without able chiefs, but it is doubtful whether any other member of the Cabinet could equal the present Prime Minister in ability to hold the unwieldy Liberal majority together. The name that first suggests itself is that of John Morley, whose personal prestige is undoubtedly greater than that of any other member of the Cabinet. As Secretary of State for India Mr. Morley has pursued a course which has commended itself to the large mass of the British people. Mr. Morley, however, is sixty-nine, only a year younger than Campbell-Bannerman himself, and he might not care to assume leadership of the House at the beginning of what promises to be an exciting campaign against the Lords. That as Prime Minister he would be able also to retain his present post is improbable. That very fact, however, might be an inducement towards accepting the higher honor; for, although Mr. Morley, as we have said, has taken a conservative view of his responsibilities as head of the India Office, the old radical and home-ruler would possibly like to be relieved of the task of dealing with conditions in India, which call for the strong hand. Augustine Birrell, though prominent, has the record of unsuccess—the Lords threw out his Education Bill in 1906 and the Irish Nationalists rejected his Irish Council Bill only a few months ago.

This year's Nobel prize for idealism in literature is, according to a preliminary report from Stockholm, to go to Rudyard Kipling. As this is the first time, since the beginning of the Nobel fund distribution in 1901, that the prize has been conferred on an Englishman, we take it that, in the opinion of contemporary Europe, Mr. Kipling holds the first place among English writers of the day. At first thought it seems somewhat anomalous that a reward for distinction in literary idealism should go to the man who more than any other in the Anglo-Saxon world has preached the gospel of force and of the material, whose muse has sung the mowing down of Fuzzy-Wuzzy's howling squadrons by British artillery and hymned the action of the steam engine. In point of fact, however, absolute idealism has not been consistently demanded by the Swedish body in whom the right to confer the Nobel literary prize is vested; for, while such previous recipients as Sully-Prudhomme or Mistral would obviously come under the founder's provision, it is only by a stretching of the term that "idealistic" correctly summarizes the work of a Mommsen or a Sienkiewicz. There is, of course, this further argument open to the devotees of Kipling, that beneath the surface brutality of his style and his theme is to be found an almost unequalled glorification of directed labor, and of the spirit of service for the common weal. This is idealism in a strict sense.

FINANCIAL CONDITIONS AND TREASURY ACTION.

All experienced financiers admit that the change for the better in the general position of our banks has now made such progress that resumption of full cash payments by depository institutions is in sight. Conferences between the bankers of New York and Chicago have been in progress, with a view to concerted lifting of the embargo on the movement of currency, and the clearing houses of other cities are asked to cooperate. This presumably indicates that the means of returning to normal conditions are assured. The chief cause of delay at present is the necessity of simultaneous action in all the larger cities where there has been partial suspension of payments. It is always possible, at such a juncture that some one untoward event may impede the process of recuperation; but in general affairs are improving.

For this happy change there are two obvious causes. One is the receipt of enormous quantities of foreign gold; $60,000,000 has arrived since November 5, and $25,000,000 more is on the way. All of this great sum is being rapidly distributed into depleted bank reserves throughout the country. The other cause is return of hoarded money to the banks —partly in response to the currency premium, and partly because of the subsiding of panic. These two processes of relief were actively at work ten days ago, before the Treasury's announcement; and, in our judgment, their influence has in no respect been helped by the government measures.

On this point we may cite the testimony of Charles N. Fowler, chairman of the Banking and Currency Committee of the House, a member of the Administration party, and a competent and impartial critic. He said in his widely published statement of last Sunday;

> On Friday, November 15 [two days before the Treasury circular was issued], the crisis of the present currency panic had been reached and successfully passed, through the splendid achievements of the American bankers.

With this utterance we are in entire accord. Through precisely the same means, in precisely the same lapse of time, and without any intervention by the government, the similar crisis of 1893 was successfully surmounted—a fact to which both the Administration and the bewildered London financiers seem to have been extraordinarily blind. The halt in the rapid depletion of New York bank reserves, first noticed in the bank statement of November 16, and the sharp fall in the currency premium at the end of last week, were evidence of recovery.

We are now more than a week away from the official announcement of the Administration's intervention. During this period certain things have been made absolutely clear. The first is that the Treasury plan was ill-digested. Nobody seemed to know just what was intended. Contradictory interpretations were put upon Secretary Cortelyou's circular. Great as was the resulting confusion in banking circles of this country, it was even greater abroad. Foreign financial authorities were all at sea. Some of them thought the issue of certificates of indebtedness was simply that of incontrovertible currency. Others failed to see that the new certificates could not possibly be used as bank reserves. Both London and Paris were in doubt about the crucial features of the project. This uncertainty alone would be a strong condemnation of the scheme. If the Treasury were to do anything at all, its action should have been so clear and precise that everybody could understand it. It is no defence of Secretary Cortelyou to say that there was a general demand that the Treasury "do something." If the head of the Treasury does not know what to do, or how to make his course even intelligible to those most directly affected, the wisest way is to do nothing.

There are, moreover, political as well as financial relations of the whole matter to be considered. It is plain that the Administration did not consult financial authorities in Congress. Chairman Fowler's severe condemnation of the Treasury measures carries great weight. Another Republican member of the same Committee on Banking and Currency, Mr. Prince of Illinois, had already indicated his disapproval. Washington dispatches tell of the sensation caused by Mr. Fowler's statement, and represent Democratic Congressmen as eager to attack the Administration for its blundering. The whole affair is certain to be a great blow to Republican prestige in financial management. "Fit to Rule" was the title of Secretary Root's panegyric of the Republican party, in his speech of 1904. The present display of fumbling and ignorance comes as a bitter comment upon that laudation. Suppose a Democratic President had put forth a scheme for currency relief which the best banking opinion condemned, and which the expert chairman of the Banking and Currency Committee declared to be of doubtful legality and of unmistakable folly—would not the Republican orators and newspapers have rung the changes on Democratic incapacity?

It is no time, however, for partisan recrimination. The thing for all of us to do, on the political side, is to prepare for the campaign for currency reform. It has long been said that not until some financial disaster befell could Congress be got to do anything to give the country a currency fit for general use and also for emergencies. Well, that disturbance has now come; the surgical operation needed to get ideas into certain heads has been performed. What should now be done is to press forward rational and practicable plans for making the currency of the country sounder and more flexible. This is a political side of the question, for it will take a great deal of campaigning and debating to get anything effective done. We need public men who will go before the people as Garfield did in the greenback craze of 1873-75, and be able to say, as he did: "I believe I have thought this thing through." With competent leadership of that kind, the present troubles may be the occasion of our coming out into a stronger and safer financial position than ever before.

AUSTRALIAN PROTECTION AND OURS.

Australia, the great political experiment station of the modern world, now purposes to show what can be done with the principle of protection carried to its logical extreme. That commonwealth, as we noted in our issue of October 24, has seized upon Chamberlain's idea of preferential tariffs, but the preference for English goods is a mere sham. The tariff is so high that when a reduction is made for products of the mother country, Australian manufacturers are still well fortified against competition. This is all very well for the manufacturer, but the Australian government, unlike our own, has now set itself to protect also the laborer and the consumer.

First, of course, comes the laborer. Sir William Lyne, Treasurer and acting Prime Minister, has laid before the Australian House of Representatives the following plan: An excise duty at the rate of half the tariff-duty on imported goods is to be imposed on all Australian manufactures; but this excise duty will be remitted in the case of all goods which are produced under "fair and reasonable" conditions of labor. The difficulty, of course, is to determine what conditions are fair and reasonable; but the Commonwealth has already taken a step in that direction by setting up a standard, conformity to which entitles a manufacturer to place upon his goods the government trade-mark. But since the old machinery is inadequate to the new requirements, Sir William would have a Board of Excise appointed by the Governor-General. This body would consist of three members, presided over by a barrister or solicitor. On its decision would rest the commercial life or death of every manufacturer—the question whether he is to carry on his enterprise or be taxed out of existence. Our advocates of a high tariff advance the argument that it raises the wages of labor; but the Australian workman is apparently not to be deceived by that sophistry. He insists that he is to have his share of the plunder, and have it at once and without hocus-pocus. Through the Board of Excise he can take the manufacturer by the throat and extort

wages, hours, and workshop rules to suit himself. Like it or not, the employer will have no practical power to resist. But the arrangement is, we think, more equitable than our own; for here the protected manufacturer has everybody else by the throat. In Australia he has a taste of the same treatment.

What particularly pleases us, however, is the provision for the consumer, whom our tariff makes not even a pretence of considering. The American laborer is told that the tariff fills his dinner-pail, but the wretched American consumer knows that for him the tariff empties pockets and fills nothing. Let him move to Australia, where he may secure redress through appeal to the Board of Excise. That bench of judges and dividers is not only to keep its eye on wages, hours, and the like: it is to report to Parliament on the state of trade, and particularly on combinations formed for the purpose of raising prices. The board may recommend to Parliament that a duty be lowered or abolished whenever the price of an article seems too high. That the recommendations may be made intelligently and with full knowledge of the facts, the inspectors of the board are to have access at all times to the books of all companies. All this recalls the sentence in Howell's "Familiar Letters" in which he describes Lucca: "She hath a Council called the Discoli, which pries into the Profession and Life of every one." If the Australian board does its duty without fear or favor, the consumer can have his turn at the throats of employer and employee, and thus complete a system of industrial throttling.

The beautiful symmetry of this plan must appeal powerfully to any man of logical mind. He is bound to argue that if the government may suspend the operation of an economic law in order to enrich the manufacturer, it should do the same thing for the laborer and the consumer. But a logical application of his theory is the last thing which the protectionist wants. If the Australian Board of Excise is created, and if it does what is expected of it, the Commonwealth will be practically where it was at the beginning. Everybody will have profited at the expense of everybody else, and nobody will be any better off. That, obviously, is not the aim of protectionists. The essence of their scheme is that they shall profit at the expense of everybody else, while everybody else has no chance to retaliate. Our own protected manufacturers would not be insane enough to foot the campaign bills of the Republican party and to pay good money for the Dingley schedules if the Republicans were to allow the workman and the consumer to take a hand in the game. That would be too much of a good thing. Your political highwayman is well aware that taking purses will cease to be lucrative as soon as the whole world adopts that calling and sallies forth upon the Great North Road. For this reason, we are haunted by the fear that Sir William Lyne's proposal may fail of final adoption—we say "fear," because we should like to lay before our American workmen and consumers an object-lesson, to show them just what they are entitled to under protection, if they had enough intelligence and courage to stand up for their own rights.

THE ARTIST AS CRITIC.

Kenyon Cox, in the preface of "Painters and Sculptors," the second series of his collected essays, raises the familiar topic of the artist as critic. His contribution comes very much to this—that the artist perforce must have opinions better worth while, from the mere fact of being a practitioner of the art he discusses, but that he will almost inevitably suffer from lack of literary skill, hence of carrying power. We are to suppose an innumerable host of artists who are admirable critics *in petto*, but inarticulate, lacking the time and opportunity to master an alien art.

When Mr. Cox speaks of lay criticism, he means presumably that of competent persons, and not the casual outgivings of half-trained writers in the daily press. He measures, that is, to take recent examples, the writings of W. C. Brownell or Gustave Geffroy against those, say, of R. A. M. Stevenson and Fromentin. Carrying such a comparison through the whole range of serious writing on art, the advantage unquestionably lies with the artists. No one can deny that the memoirs of painters, for example, are our most valuable documents for the judgment of painting. From Leonardo, through Vasari, Reynolds, Constable, Delacroix, Millet, Carrière, Segantini, and our own John La Farge, we have from artists an enormous and precious mass of opinions about their art. Professional criticism can make no such showing.

Yet a summary verdict against the defendant would be premature, for the reason that lay criticism is in its adolescence. Indeed, only in very recent times has criticism had its necessary basis in an accurate history of the art of the past. And this brings us to the significant fact that in the new connoisseurship artists have had a very small part. The ungrateful but certainly indispensable drudgery of determining what a given artist under consideration actually painted or modelled has been conducted almost exclusively by laymen. We hasten to say that this is not criticism at all, but merely the ascertainment of its materials. Yet it is at least remarkable that artist-critics have not only been averse to this humble pursuit, but also suspicious of its more certain results, and in general prone to express opinions as if it didn't really matter whether a picture under discussion were by one artist or another. Such an attitude is an almost inevitable result of the artist's confidence in his own instincts and of his lack of minute scholarship.

We concede readily that criticism lies in a region of appreciation where minute scholarship is not of the first importance. On the other hand, one must distrust any criticism that is not sure of its data, and we may suppose that the criticism of the future will be more systematic than the *disjecta membra* which constitute the interpretation of art by its past practitioners. In other words, there seems to be more hope that connoisseurship may rise to criticism, as its lesser task is accomplished, than that we shall always depend upon the casual excursions of artists in an art which is not theirs.

The real weakness of the artist as critic lies in the fact that the arduous practice of his craft must restrict his opportunities for wide observation. A real critic who would devote a third of the time to galleries that is given by the average connoisseur would gain an equipment with which no active artist could possibly hope to vie. The artist, in short, may speak from perfect insight, but, unless he be an *artiste manqué* (and these the malicious say make the best critics), from imperfect knowledge, whereas the professional critic has every opportunity, not only for immediate observation, but also for the study of the writings of artists and for present and valuable association with the best practitioners of his time.

We do not believe that the artist-critic will ever be superseded. There will always be painters who indulge a curiosity about the theory of their art and have something worth saying on the subject. But we feel that the alleged rivalry between the two sorts of critics rests at bottom upon a pure misconception. Mr. La Farge has somewhere marvelled that critics so seldom write anything worth an artist's reading. What an unfair demand to make of a critic! As regards the artist, the critic necessarily deals either in banalities or in startling inferences, which may, however, be just the kind of interpretation which his real public needs. In short, the professional critic addresses the general public, the artist usually his own craft. Thus they are allies, not rivals. And if the opinions of artists on art have become more or less the common property of the cultivated, the merit accrues largely to professional criticism.

The sum of the whole matter seems to be that the critic should stand upon the sure ground that he, too, is an artist—an artist in letters; congratulating himself that his material is not unassorted nature, but its beautiful interpretation in another art, and accepting

gladly as a potent source of suggestion all expressions of artists about their own art. Such a critic will be free from the crude notion that he is a preceptor to artists. Towards the public his responsibility will lie, and his judges will be found, not among artists, but among the cultured, that is to say the competent minority of that public.

M'CLINTOCK AND THE FRANKLIN SEARCH.

The death last week of Sir Francis Leopold McClintock at the age of eighty-eight removes the last but one of the famous Arctic explorers of the first half of the nineteenth century. From 1840 on there raged in England a veritable fever for Arctic discovery. It was not only the North Pole which lured, but also the centuries-old quest of the north-west passage. When Sir John Franklin returned to England in 1844, after seven years as lieutenant-governor of Van Diemen's Land, he found the Admiralty bent on a naval expedition through the polar seas to the north of the American continent. At once Sir John applied for the command as the senior officer of Arctic experience. But his age made the Admiralty hesitate. The First Lord remarked to Franklin that he was sixty years of age. "No, no, my lord," was the reply, "only fifty-nine." The First Lord yielded, and Franklin's fate was settled. With the Erebus and Terror he sailed for the ice-pack on May 18, 1845.

By 1847 the absence of any news led to the first relief expedition. So general was the belief in a disaster that the next year no less than five other vessels sailed for the Arctic. Three more expeditions followed in 1849, ten in 1850, two in 1851, nine in 1852, five in 1853, two in 1854, one in 1855, and, finally, that of the Fox in 1857. Never before or since has there been such a rush to the Arctic; even in America the tragedy so stirred the public that Dr. Kane made his venture in the hope of disclosing its details. Not until 1850 were any traces of Franklin and his large crews discovered, and then only vast stocks of preserved-meat canisters whose putrid contents Franklin had had to destroy, thus fatally diminishing the three years' supply of food which the Erebus and Terror were supposed to have on board. Four years later, in 1854, Dr. Rae, a factor of the Hudson's Bay Company, heard from the Eskimos of the deaths of many white men near Back's Great Fish River, and purchased from them numerous small articles, silver spoons, etc., and a silver plate engraved with Sir John Franklin's name. But it was not until 1859, fourteen years after the departure of Franklin's two ships, that Sir Leopold McClintock uncovered the whole story of the fate of the Erebus and Terror and their crews.

McClintock served in 1848 as second lieutenant of Sir James Clarke Ross's unsuccessful relief expedition in the Enterprise, and then in 1850 joined that of Capt. Austin. From 1852 to 1854 he was again in the Arctic regions on one of a fleet of five relief ships, gaining thereby the experience in sledge work which led Lady Franklin to select him for the command of the Fox, the yacht fitted out in 1857 and destined to bring back not only many relics of the expedition, but a fairly connected narrative of its fate. The Fox was, for its time, a powerful screw steamer. No sooner was it in winter quarters than McClintock, Lieut. Hobson, and a volunteer merchant sailor, who, as Sir Allen Young, is alive to-day to mourn the death of his companion of fifty years ago, set out in their search. McClintock purchased a dog-team, the full value of which he was perhaps the first explorer to appreciate, just as he was the first to make long journeys by this means of locomotion. Soon he met Eskimos who could give him information of the Franklin party. After a long and vain search along the southern coast of King William's Land, he finally found, on returning towards his vessel, the place where one of Franklin's ships had sunk and where the other had gone to pieces on the beach. Not until early in 1859, however, did McClintock light upon distinct traces of the dead explorers—the skeleton of one of the sailors. Five days later he stumbled upon a boat mounted on a sledge, and containing, besides two bodies, a miscellaneous assortment of articles, but no food.

From that time on discoveries were frequent, until Lieut. Hobson came upon the cairn enclosing the only written record of the Franklin expedition. From this it appeared that Sir John Franklin had died on June 11, 1847, and that eight other officers and fifteen men had died before the date of the report, April 25, 1848. On the next day the remaining 105 officers and men set out on foot for Back's Fish River with almost no food and without hope of obtaining any. All perished miserably, some on King William's Land, some on the mainland by Great Fish River, and others, as an Eskimo woman told McClintock, "falling down and dying as they walked." The record was enough to entitle Sir John Franklin to the title of discoverer of the Northwest Passage, and this designation is on his statue in London. The details of his journey McClintock published, as we noted last week, under the title of "The Fate of Sir John Franklin." He was received with great enthusiasm on his return to England, and honored by three universities and many learned societies, not only because of his success in finding the Franklin records, but because of his own ability, intrepidity, and endurance.

In his long life McClintock lived to see many changes in methods of Arctic exploration, and a wonderful increase in the world's knowledge about that frozen portion of the globe in which he spent so many years. His feelings on receipt of the news that Capt. Amundsen, in the Gjoa, a mere cockle-shell in comparison with the Erebus, Terror, or even the Fox, actually navigated the North-west Passage in 1905-06, may easily be imagined. The Franklin expedition was almost the last in which large crews participated. Since then the numbers of an expedition have steadily decreased, until now a mere handful of whites is sufficient crew for a Roosevelt or a Fram. Just as McClintock learned to use the dog-sledge for long journeys of hundreds of miles, so the explorer of to-day stakes everything on the dogs; and the fashion he set of relying on the natives has likewise come to stay. McClintock witnessed, moreover, the experiments with an entirely new conveyance—the airship. No new McClintock has as yet discovered the fate of Andree, and no explorer of the old captain's experience is yet on record as believing in Wellman's plan of a dirigible balloon.

TURGENIEFF AND THE MODERNS.*

To turn from the hectic literature of present-day Russia to the sober pages of Turgenieff is not merely a relief, but a valuable exercise in the just appreciation of values. Between the death of Turgenieff and the appearance of Gorky less than ten years elapsed; but we cannot bring the two men into juxtaposition without being seized immediately with a sense of the vast distance Russian literature has travelled in the interval. It is easy enough to draw up an array of reasons why striking differences should be found. Turgenieff, though he continued to write well into the third quarter of the nineteenth century, was essentially an adherent of the school of liberal thought which we associate with the year 1848 on the Continent; Gorky is in advance even of his own age. Turgenieff was a nobleman, and he studied the Russian peasant and petty burgher from a detached though sympathetic point of view; Gorky professes to be of the submerged classes from among whom he has drawn his most popular literary material. Turgenieff wrote in times of comparative social and political peace; Gorky is the preacher and leader of active social and political revolution. In Turgenieff the Slav nature was strongly impregnated with the culture and tastes of the West; Gorky speaks no language but his own and is decidedly not in touch with Occidental standards, or prejudices, as we may choose to call them. Turgenieff, in consequence, employs the calm accents of the man of good breeding, while Gorky exemplifies proletarian lack of self-restraint. And so we might continue to multiply distinctions. It is safer on the whole to dispense with all attempts at causal analysis and simply to state the puzzling nature of the problem. Here are two men who bring to bear on the same subject. Russia, presum-

**The Novels and Stories of Ivan Turgenieff.* Translated from the Russian by Isabel F. Hapgood. 14 vols. New York: Charles Scribner's Sons. $1.25 each.

ably the same artistic method—a thorough realism capable of reproducing both the truth of the photograph and the truth of high intuition; yet the ultimate impression is far from being the same in both and we are confronted with the question, Which of the two has erred less in the application of his method, which, in other words, is the better "realist" of the two?

The temptation to decide at once in favor of the younger man is natural. We have called both men thorough; but if thoroughness is to mean ruthlessness of vision and statement, Gorky and the newer writers who follow his footsteps can easily establish their claims to the mastery. These moderns have investigated everything—race, the individual, country, home, sex, belief, superstition, disease—with self-immolating cruelty. They have taken nothing for granted, because nothing is too sacred, or too certain, or too unimportant to be tested and recorded. They have had on their side the wider freedom of utterance of which we are growing increasingly tolerant, and they have not been bound by literary canons of any kind. If they have felt the desire to preach they have done so in violation of the current belief that realism must not be didactic, as Gorky has preached in "The Abyss," "The Vacationists," and his latest work, "Mother," recently published in this country. If they have wanted to indite psychopathic analyses scores of pages long, they have not hesitated before certain requirements of formal rhetoric dealing with rapidity of movement, as Andreef has done in his tremendous study of inherited evil, "The Life of Vassili Fivyeiski." They have put forth dramas in which nothing essentially dramatic occurs, like Gorky in "The Children of the Sun"; and created characters in the image of the authors that made them, like Chirikhoff in "The Jews." Why, then, should not the artist who has emancipated himself from the restrictions imposed by tradition upon the practice of his craft succeed in getting by so much the nearer to the essence of reality? Contemporary Russian taste is precisely of this opinion. It will have nothing but the extremest literary diet, on the supposition that this is also the most natural. War with its reek of mangled limbs, eviscerations, and blood madness; the pogrom with its inevitable slaughter of infants and free play of lust; the hospital, the morgue, and the insane asylum are the favorite topics of the day. Indeed, Gorky himself has been out of favor for some time because of his comparative moderation. Leonid Andreef, who surpasses him in his predilection for the horrible, was the favorite author two years ago, after the appearance of "Red Laughter," a picture of Russo-Japanese battle trenches. Andreef's supremacy is now said to be threatened by a certain Erastoff whose gift for the soul-racking in the same field is still more pronounced. Next year it is pretty sure to be a new man who will have blazoned his name across the Russian page in scarlet and fiercest black.

Compared with these men of the Extreme Left in Russian literature, Turgenieff cannot appear at first sight as other than a mild and apologetic *bourgeois* of the Constitutional Centre, if not indeed of the Moderate Right. Turgenieff prefers to remain within the proper limits of the particular literary form he selects. He is genteelly decent in speech and obsequious to old conventions on such subjects as romantic love, sacrifice, the validity of the religious instinct, the merit of humility, the gradual advance of human history; he has his doubts as to the efficacy of revolution. On the other hand, with regard to these very traditions which he accepted as of account in the exercise of his profession, he was, personally, a skeptic; and if literature and life are to be made identical, must not literature be the creation of some one who believes strongly, whatever be the object of his belief? Not reactionary enough to possess the mystic vision, not radical enough to make use of the modern methods of unrestrained artistic investigation, how shall Turgenieff claim to have seen life as closely as Gorky has seen it in his "Abyss" or Andreef in his "Once Upon a Time" and "Red Laughter?"

This is *a priori* reasoning. The plain fact is, however, that in practice Turgenieff's work seldom fails to ring completely true, while that of our contemporary Russian writers seldom succeeds. And if the difference may be accounted for in a single sentence, we may explain it as arising from the circumstance that throughout the elder man's work runs the sense of life striving towards law and health, whereas in Gorky and his companions the dominant note is one of chaos and disease. That the one formula is nearer the truth than the other is ultimately, of course, a matter of faith; but it is a faith so widely held as to include among its votaries even our revolutionary authors. That law and health should be the order of life, but are not, is what Gorky and his kind assert; and all the violence of their pitiless realism is directed towards the reconstruction of life on these ideal principles. In Andreef's "Savva," for example, we are introduced to the young Russian who has become convinced that the world must be swept completely clean of institutions and men in order that evolution may take a new start. Yet it is singular how utterly the new men fail to convince us of the possibility of their perfect world. Gorky, for instance, with all his vociferous optimism for the future, a future in which there shall be neither want nor oppression, nor choked up inner life, nor grovelling thoughts, leaves us nevertheless with the mere feeling that life is too miserable a thing ever to be transformed into anything better. The blind beggar Luka, alone among the degraded inhabitants of his subterranean phalanstery of "The Abyss," testifies in mystical fashion to the existence of some form of spiritual life; but Luka's philosophy is not the one that dominates the final impression. Turgenieff, on the other hand, without indulging in ecstatic visions of the future, and with only a skeptic's tolerance for the facts of the present succeeds in conveying with unmistakable force the belief that existence has purpose and value, incapable, though these may be, of clear determination, refuted though they may constantly seem to be by the death of a Bazaroff in "Fathers and Children," or an Insaroff in "On the Eve," or the fate of a Liza in "A Nobleman's Nest."

To be more specific—from a Western point of view, for instance, the Russian people are, to put it in homely phrase, a queer lot. Their naïveté, their emotional exuberance, their inability to recognize the practical or to cling firmly to the ideal for which in moments of stress they may be ready enough to lay down their lives, their over-developed power of self-analysis—these qualities find expression in every page of their imaginative literature. Russian men will fight each other one moment and embrace each other the next in Gogol, Turgenieff, and Tolstoy, as in Gorky. And according to all of our authorities, Russians will alternate between Oriental cruelty and a feminine softness of repentance, or will tear their hearts open for their friends to look into and will fib outrageously immediately thereafter, or will get drunk and beat their servants and then grovel before them in contrition, or will break the moral law repeatedly and take their own lives on an empty scruple. In Turgenieff as in Gorky the good may perish, the evil triumph, the ridiculous lord it over the æsthetically fit. But in the end the fundamental difference of the two men overcomes all similarity of theme or major treatment. Turgenieff's heroes, cowards, tyrants, victims, drunkards, and clowns, for all their eccentricities, appear as essentially conditioned by the main facts of life in which they are rooted. With Gorky they seldom lose the impression of primal eccentricity, of the abnormal, the monstrous. Turgenieff's characters are men and women experiencing pain and bliss. In Gorky we have only personified aches and satisfactions. To grasp the difference we need only compare a few of Turgenieff's short stories, "Petyushkoff," "A Reckless Character," "The Watch," with Gorky's "Twenty-six and One," "Konovaloff," or "Malva."

From the point of view of mere technical proficiency, therefore, it should seem as if the young Russians in casting aside literary restraint have not only failed to gain any advantage over the conservative methods of a Turgenieff, but have actually placed themselves in a position of distinct inferiority by mingling artistic observation with a personal philosophy. For, to refuse to be bound by existing canons is decidedly to advance a philosophy of one's own. If truth is to be the object, the uncompromising naturalism of Gorky and Andreef is vitiated to a far greater extent by their doctrinal nihilism than Turgenieff's realism could ever be by his subservience to tradition. Upon the ordinary reader, with little doubt, the intransigeant methods of the younger men produce the weaker impression. When Turgenieff accepts certain things and denies certain other things, the presumption is at least that he is endeavoring to discriminate between the true and the false. But when Gorky finds in the upper classes of Russian society only high-fed oppression, in the middle classes brutal indifference, in the lower classes stupid helplessness; when the ignorant are only beasts, and the intelligent, birds of prey or weaklings; when love is only animalism, and reason is madness, and virtue is timidity, and courage is dulness, the mind at once suspects the operation of a rigid formula and denies verisimilitude to the entire result.

Actually, it is a question whether the present generation of Russian writers is not too "modern" to be realistic in the sense that Turgenieff was a realist. We

find in Gorky, for instance, the entire conglomeration of vague and incongruous ideals, which is the peculiar character and pride of "modernistic" thought all over Europe. It is a continuous swing between the brutalities of an unchecked naturalism and surrender to mystic aberration. It blends the supposedly latest truths of biologic science with the chivalry of the Middle Ages and the spirit that animated the sexual nature-worship of the pre-Christian Orient. It is a mixture of democracy and the doctrines of Nietzsche, of pastoral simplicity of emotion and decadent æstheticism. The "modern" soul is assumed to be sick with the sins of many millenniums, and worn out with self-contemplation, yet strong enough to defy the resultant wisdom of such sin and introspection. Old with the vanity of all pleasures, it is young enough to cry aloud for all pleasures. Tax the "modern" mind with being illogical, and it brings forward its theory of the greater worth of the passions over the intellect. Argue that passion is eminently simple, and the reply comes that it is the business of the intellect to develop the play of the passions to more complex potentialities. "Modern" thought is fond of the grand style of discourse. It speaks of the cosmic opposition between the male and the female principle, and of the love between man and woman which is hate, and the hatred of the sexes which is love; and is rather fond of petty lubricities. It has gone far to recreate the view of woman as a creature of pleasure and evil that was held by the monks of the Thebaid; but it insists on bestowing on her the suffrage and state support for her offspring. In the ideal world of the modernist, the primal animal passions are made the bases of society and the conditions of civilization's progress. In that world men walk about in the midst of antique beauty without being tainted with the mould of old age; Quixotes in their capacity for action, Hamlets by their insight into the hidden things of life; sinning with the body, but never with the soul; commanding no one and obeying no one—members, in short, of a reconstructed world-scheme where planets and star clusters, bound by no compelling law, swirl about in orbitless spontaneity, yet unite, strangely enough, to form an harmonious universe.

Into such perversity of ideals our modernist writer will fall, because, at bottom, what he studies and depicts is not objective life—and this in spite of an apparent relentless realism—but the fluctuations and shades of his own perverse artist's soul. The earlier Gorky ranks higher as an artist than the man who wrote "The Abyss," "Children of the Sun," or "The Petty Traders." For, even if that earlier work was already marred by a pervading pessimism which must have been the personal contribution of the citizen-born and bred Gorky to the life of the under world, the subjective element was comparatively inconspicuous. But even in his earlier sketches we miss the touch of absolute reality that marks Turgenieff's peasant studies in the "Annals of a Sportsman." Gorky's vagabonds and proletarians are too voluble, too introspective, too coarse and too cynically fine by turns; and the problems they are represented as consciously dealing with are only Gorky's elaboration of what may have run as dim sensations in the minds of his originals. In his rare idyllicism, as in his representation of ugliness, brutality, and the violences of sex, he is over-elaborate, over-emphatic; he shocks, stuns, shatters, but by the very vigor of his onset creates a speedy reaction towards disbelief.

We turn at random to one of Turgenieff's longer short stories—"Spring Freshets" it is called in Miss Hapgood's translation—to find a satisfying example of what we mean by the realism that stoops to convention when it pleases, abstains from the terrifically tragic or the horribly grotesque, makes no excursion into the fields of technical neurology, or economics, yet leaves us with a poignant bit of literature that compels acknowledgment of its veracity. The first love of a young man is described without his being made either a poet or a faun; his encounter with temptation and his fall are told without the least squeamishness, with a terrible directness, in fact, which our modernists would greatly value were it not for its freedom from sordid detail; and the entire tragic little story remains a piece out of the very core of life, in its implication of law, of health, and the supremacy of the spirit, which, whether we will or no, the mind demands as the essentials of life.

S. Strunsky.

NEWS FOR BIBLIOPHILES.

Besides the Browning items noted last week, there are a number of exceptionally interesting books to be offered in the Buckler sale by the Anderson Auction Co. of this city on December 3. The most notable item is Milton's Bible, a fine copy of the quarto Genevan, or "Breeches," version, printed by Christopher Barker, 1588. On a slip pasted inside the cover is the autograph signature and date "John Milton, February 24, 1654." On the title of the New Testament is the autograph—"Elizabeth Milton"—Milton's third wife—and on the fly-leaf her maiden name, "Elizabeth Minshull," as well as signatures of several other members of her family. There are other association books of great importance, including a copy of the earliest issue of Halle's "Chronicles," with writing on blank leaves by Sir Henry and Mary Sidney, the parents of Sir Philip Sidney and his sister Mary, the Countess of Pembroke; a copy of the first edition of the first part of Butler's "Hudibras," given by the author to his "honor'd frien Captain John Grant"; the copy of "Prometheus Unbound" which Shelley gave to Trelawney a few days before his death; Lamb's "Elia," given to John Howard Payne; William Wycherley's Works, given by the author to Sir George Browne; "Marmion," in a tartan binding, given by Scott to Wordsworth; Thackeray's copy of the first edition of "Gulliver's Travels"; presentation copies of several of Longfellow's books and of Lowell's "Commemoration Ode." The "Commemoration Ode" is the French copy, and cost Mr. Buckler $410 in 1901. The Pyser copy, presented by Lowell to Sophia J. Townsend, brought $531 last year. Maria Lowell's "Poems," 1855, is the Arnold copy, which brought $90 in 1901. The record is $210 for the Bartlett copy, which had the original manuscript of one poem, "The Necklace," inserted. This is the most important sale of the season thus far; and, while, in the opinion of some, the present is not an opportune time to sell rare books, on the other hand, if prices rule low, now is precisely the time to buy.

Hodgson & Co. of London sell on December 10 and 11 a notable collection of books on Napoleon and a collection of first editions of modern English authors. Among the latter is a remarkable collection of the first editions of the books of Robert Louis Stevenson, including some of the rarities, such as "The Charity Bazaar," "Deacon Brodie," "Admiral Guinea," "Macaire," "The Story of a Lie," and "An Object of Pity."

On December 3, 4, and 5 C. F. Libbie & Co. of Boston sell the library of Eugene W. Hildreth of Melrose, Mass. It contains a series of Eleazer Wheelock's Reports on the Indian Charity School, which afterwards became Dartmouth College. The same firm will offer the autograph collection of Matthew A. Stickney of Salem on December 18 and 19. It comprises signers of the Declaration, Presidents, members of the Continental Congress, Revolutionary generals, and American authors. An early survey by Washington, dated April 4, 1750, also a page A.L.S., written from the camp at Cambridge, October 28, 1775, are two notable specimens.

Correspondence.

THE REAL E. A. HOFFMANN.

To the Editor of The Nation:

Sir: The production of Offenbach's "Contes d'Hoffmann" at the Manhattan Opera House, and the remarks of the metropolitan critics regarding the opera and its author-hero, Ernst Amadeus Hoffmann, give the pessimist another opportunity to moralize on the injustice of posterity. Literary and musical tradition, even before his death, made over the versatile little lawyer and story-teller into a sort of reincarnated François Villon, a gay Bohemian, who spent his days in love-making and his nights with boon companions in the wine-cellars of Bamberg and Berlin. Like the hapless Poe, Hoffmann fell into the hands of a Philistine biographer, the Berlin publisher Hitzig, who exaggerated his faults, and altogether failed to understand his character. Since that time the professional literary historians have used him mainly to point a moral. His nervous and eccentric manners and uncanny appearance, his versatility as artist, musician, composer, and author, and above all, his fancy for the theatre and for a genial glass afterwards, set in motion a flood of legends which still eddy about the nooks and crannies of old Berlin, notably the old wine-room of Lutter and Wegner on the Gendarme Market, one of the most interesting and suggestive landmarks of literary Berlin in the early decades of the nineteenth century. The legend-weaving German mind, which identifies Byron with Don Juan, just as naturally finds Hoffmann again in his own half-insane musician Johannes Kreisler, the hero of those strange fancies which Robert Schumann set into music. How could the author of these and the

"Nachtstücke" be other than a ghost-seer in real life? Doesn't it shock us all just a little to find that Mr. Rider Haggard and Mr. H. G. Wells are ordinary, well-behaved gentlemen?

In Germany of late the unpicturesque philologists have been having a sort of Hoffmann revival and smashing the Hoffmann legends. It turns out that he was a successful lawyer, a conscientious and painstaking government official in the East Prussian provinces, a successful conductor of operas in Dresden and Leipzig, and finally after the fall of Napoleon a trusted judge in the Prussian Court of Appeals until his death. In this last position, according to records in the archives cited by Dr. Ellinger in a recent article in the *Deutsche Rundschau*, he won the plaudits of his superiors by his ability and conscientiousness, it being expressly stated that his serious and dignified demeanor showed no trace of the fantastic and comical story-teller.

The object of this letter, however, is not to assist in the thankless destruction of the picturesque Hoffmann saga, but merely to call attention to the unfading attractions of those weird, realistic tales of his. Every one of his contemporaries, except the eccentric Heinrich von Kleist, has ceased to be more than a name to the German reading public, but each year brings a new edition of one of Hoffmann's fantastic tales—the "Devil's Elixir," with its dread *revenants*, the "Entail," a prototype of Poe's House of Usher in its icy realism, or the delightful irony of "Murr the Cat," the ancestor of a race of literary tom-cats, who philosophize through the German fiction of the nineteenth century. "Il a toujours un pied dans le monde réel," says Théophile Gautier, explaining with a word the trait which separated Hoffmann from the dreamy Romanticism of his time. This same realism has made him a French classic, more popular than either Goethe or Heine. It made him also one of the creators of the short story, which grew up in England and France under German Romantic influences.

As a composer Hoffmann was scarcely less famous during his lifetime than as a story-teller, but an evil genius has pursued his musical works. His "Undine," the greatest Romantic opera before Weber's "Freischütz," was exceedingly popular in Berlin until scenery and decorations were destroyed by the burning of the Royal Opera House in 1817. His numerous sonatas, fugues, and *Singspiele* are still in MS. in the Berlin Royal Library. Perhaps this period of Romantic revivals may yet see some of his work resurrected. In the history of music Hoffmann holds an honored place as having been the first critic to appreciate Beethoven rightly. His tales have furnished themes to many other composers besides Offenbach, from Wagner to Carl Reinicke. The "Meistersinger von Nürnberg" and "Tannhäuser" both owe much to Hoffmann's stories, and a recently printed sketch from another opera outlined by Wagner while in Paris, "Die Bergwerke von Falun," is based on one of Hoffmann's best stories.

ROBERT H. FIFE, JR.

Middletown, Conn., November 19.

SIMMS ON AN EARLY COMMERCIAL CRISIS.

TO THE EDITOR OF THE NATION:

SIR: The following from William Gilmore Simms's "Views and Reviews" (1845) shows that in the commercial world history repeats itself. Simms is writing of the conditions preceding and following the commercial crisis of 1837:

> The chief cities were diseased to an enormous extent. Their evil influences were spreading to the country. The rankness of trade and speculation had overrun the land; its vices were fast usurping the place of virtues; fraud was a bold politician, prescribing laws for the people, and matters for government, as if the propriety for his existence were no longer matter of dispute. . . . Long impunity and constantly increasing numbers had made the criminals bold and reckless. They laughed at ordinary reproof, they mocked at wisdom, and despised censure. . . . A terrible punishment was preparing for the excesses of our people—unhappily a fate which has made the innocent pay the debts of the guilty—which has swept all with a common besom. The laws of industry, common sense, and common honesty, are not to be long outraged with impunity; and the recoil came and the retribution; and we are what we are now, and—so far as mere social prosperity is concerned—what, it is feared, we must very long remain. In morals, we trust there is improvement. God works out his purposes to this end, and he does not often work in vain. We are pleased to think, and somewhat proud to say, that, touched by adversity, scourged by the just judgments of heaven, we are an improving people. Vice is less audacious, pride less boastful, labor more honorable, truth better esteemed, if not yet wholly triumphant.

If Simms describes the conditions of the present day, does he also foretell a coming retribution? F. C. PRESCOTT.

Itbaca, N. Y., November 4.

THE GIFT TO SWARTHMORE.

TO THE EDITOR OF THE NATION:

SIR: The bequest recently referred to in your columns, of $3,000,000 (estimated) to Swarthmore College, upon condition that it give up intercollegiate contests in athletics, presents a question which concerns not only the beneficiary college but also all who are interested in the cause of education.

From the point of view of education the question would seem easy of solution. Inasmuch as there can be no rational and consistent educational ideal which requires intercollegiate athletics for its attainment, there seems to be no doubt that $3,000,000 wisely spent would accomplish vastly more for the cause of education than intercollegiate athletics could possibly accomplish.

And inasmuch as the sole *raison d'être* of the college is to further the cause of education, the question would seem, at first blush, to be equally simple from the point of view of Swarthmore College. And so it probably would be if college authorities were free to pursue their proper aims; but under present conditions our colleges must conform more or less to popular sentiment. A college must have students, and to that end it must accede to the popular taste. Young America to-day knows far better than pedagogic wiseacres what is good for him. If he prefers football to scholarship (and he usually does) he is going to the college where he can get much football and little scholarship, with the result that the football college will flourish while the scholarship college may decline. Hence the question before Swarthmore is whether it can risk the unpopularity involved in deciding in favor of scholarship as against intercollegiate athletics.

This, in truth, is the problem which really confronts all colleges, and which can be settled only by a practical test. Some college of standing and financial strength should try the experiment. It might thereby lose popularity for a time, but it would gain in reputation for scholarship—a gain which might in the end far exceed the loss. The opportunity is now presented to Swarthmore to become a pioneer in this movement. For such championship this college seems to be peculiarly fitted. The proposed bequest would give it a large measure of financial independence; and its already excellent standing in educational work, coupled with the courageous devotion to scholarship involved in the proposed change, would naturally attract the class of students which is really the most desirable for any college.

To those who are deeply interested in education and who are unable to see any particular educational value in intercollegiate athletics, the rejection of this munificent gift and this magnificent opportunity would seem little short of a calamity.

HERBERT L. BAKER.

Detroit, November 22.

Notes.

E. P. Dutton & Co. publish this week "Over-Sea Britain," by E. F. Knight, and "Studies in the History of Venice," by Horatio F. Brown.

At her death, the late Mrs. Slack, of Croyden, left the original letters between Shelley and Miss Hitchener (1811-12) to the Rev. C. Hargrove, with directions that they should ultimately go to the British Museum. Mr. Hargrove has, however, turned them over to the Museum immediately, and they are to be published by Bertram Dobell. The series consists of forty-four letters from Shelley, five from Mrs. Shelley (the first), and twelve from Miss Hitchener. Dowden made use of the correspondence when writing his "Life of Shelley," but it has never before been printed in full, except in a private edition of thirty copies, by T. J. Wise, in 1900.

Taking the four volumes before us as specimens, we heartily commend the Prairie Classics of A. C. McClurg & Co. as one of the neatest and most readable editions of the novelists ever put on the market. The books are small but not "pocket size," the paper opaque and stiff enough to turn conveniently, and the type is clear and of fair size. The price is low, one dollar a volume. Each volume contains a frontispiece in colors by George Alfred Williams. It is the intention to give in time the complete works of each author. So far "Kenilworth," "Ivanhoe," "A Tale of Two Cities," and "Oliver Twist" have been issued.

Dr. William Morton Payne's "Greater English Poets of the Nineteenth Century" is a series of lectures on Keats, Shelley, Byron, Coleridge, Wordsworth, Landor, Browning, Tennyson, Arnold, Rossetti, William Morris, and Swinburne. His purpose,

as stated in the preface, is "to examine their poetry in respect to its intellectual content, to set forth their ideas on religious and philosophical subjects, and to discuss the political and social conditions of their time." Such a tempting programme raises expectations which the essays themselves by no means satisfy. It implies an amount of time and study that might task the energies of a Taine, and more than ordinary critical acumen. But only the more obvious significance of each author's work is treated. Dr. Payne attempts so much that his treatment is bound to be sketchy. He feels it necessary to justify his omission of Scott in favor of Landor, but his reasons are not convincing. To ignore utterly the estimates of such competent judges as Shairp, Saintsbury, Palgrave, and Ruskin is one more indication of the present curious depreciation of Scott by our American pundits. Can they know his work at first hand? Landor lives, if at all, by his prose and a few exquisite lyrics, not by his frigid Gebirs,. which have few charms and no influence. It must have been Landor's republicanism which secured his inclusion in this choric band; but Landor was a republican of classic Rome, a fierce aristocrat, who could not endure "the people." Dr. Payne praises the right men generously for the right things; he quotes copiously from the poets themselves and he leans hard on their critics. His best chapters are on Tennyson, Browning, and Arnold; the treatment of Coleridge and Morris cannot be regarded as adequate. (Published by Henry Holt & Co.)

A book on Meredith raises the previous question: Is he a great novelist? On the sturdy Philistine, who prefers Pickwick to Shagpat, such a treatise as Elmer James Bailey's "The Novels of George Meredith: A Study" (Charles Scribner's Sons) will hardly work a change of heart. His praise is often so faint, his concessions to adverse criticism are so frequent, that, at the end of the argument, he and the Philistine might almost shake hands. The book consists of five chapters, dealing with the development of Meredith's genius, and a list of the characters in his novels. Neither the style nor the matter is of a kind to inspire confidence. The style is rather pompous; "diatribes" are "hurled" against "citadels," and that sort of thing. Incidental statements of fact are often surprising. For instance:

> In 1828, of the poets favorably known during the early part of the century, Byron, Shelley, and Keats were dead; . . . Tennyson and Elizabeth Barrett were but just known, and Browning had not printed "Pauline" (p. 17).

The new and interesting part of the book is a sketch of Meredith's influence upon other novelists.

In the Introduction to her "Vers de Société Anthology" (Scribners) Carolyn Wells discusses the various English phrases that have been used for this kind of verse and finds them all, as indeed they are, in one respect or another wanting. Her own suggestion Gentle Verse strikes us as capital, and we could wish she had boldly made it the title of her book; it fits well her definition of the kind as depending for its spirit "on an instant perception and a fine appreciation of values, seen through the medium of a whimsical kindliness." Gentle Verse would thus imply the life of gentle socity viewed through the mind of such a poet as Thackeray's "Gentle Saint Charles" —not a bad interpretation of *vers de société*. We remark in this connection that, with all her catholicity, Miss Wells has not included in her list a single poem of Lamb's; surely, some of his album verses deserve a place with the best she has collected. Nor is her taste in other matters always sure. Only two of T. B. Aldrich's poems are given—one of these by no means of his best —against seven by H. C. Bunner and four by Gelett Burgess. This simply shows lack of fine artistic sense in the collector. But it is almost always easy to pick such flaws in an anthology; the important fact is that here we have a large body of *vers de société*, brought together from the most widely separated sources—an excellent book to read.

"Voyages of the Elizabethan Seamen: Select Narratives from the 'Principal Navigations' of Hakluyt," edited by Edward John Payne, has been issued in a new edition by Henry Frowde. This work, first published in 1880 and again in 1893 and 1900, has now been condensed from two volumes to one by the omission of the last letter and last voyage of Thomas Cavendish and of Raleigh's "Discovery of Guiana," together with the introductory matter relating to these texts. The volume now contains an excellent Introduction, including an account of the life and works of Hakluyt; the Directions for Taking a Prize, from Capt. John Smith's "Seaman's Grammar"; and accounts of various voyages of Hawkins, Frobisher, Drake, Gilbert, Amadas and Barlow, and Cavendish. C. Raymond Beazley, whose third volume of "Dawn of Modern Geography" was reviewed in the *Nation* of October 10, has furnished some additional notes and maps.

"Round About the North Pole," by W. J. Gordon, with woodcuts and other illustrations by Edward Whymper, is just issued by E. P. Dutton & Co. A more inspiring record of bravery, endurance, sacrifice of self for the sake of one's comrades, unflinching devotion to duty in the face of deathly peril, it would be difficult to find than is contained in this account of the heroes of Arctic research. In telling the story of the different expeditions from that of Sir Hugh Willoughby in 1553, to Robert Peary's in 1906, the author has divided the region into sections, beginning with Spitzbergen and following the circle to Greenland, describing the exploration of each section by itself. The main incidents and achievements of the various expeditions are grouped together with numerous extracts from journals and anecdotes. Among these is the story told by Joseph Moxon, hydrographer to Charles II., of a conversation in Amsterdam in 1652, with a sailor of a Greenland ship. This veracious tar said that he "sailed to the North Pole and back again, and even two degrees beyond it; no land seen, no ice, and the weather as it was in summer-time at Amsterdam." Naturally the greatest space is allotted to the older and less known voyagers, but this plan is at times carried too far. More than ten pages, for instance, are devoted to Barents, but the account of Amundsen's accomplishment of the Northwest Passage occupies less than a page. There is no mention whatever of Walter Wellman's expeditions to the northeast of Spitzbergen, and to Franz Josef Land, nor of the Ziegler expedition of 1903-5 led by Anthony Fiala. Six sectional maps and sixty-seven illustrations, including thirteen portraits of the most famous explorers, and reproductions of pictures in old works add much to the interest and attractiveness of the volume. There is an excellent index, but the value of the work would have been much increased if it had contained a bibliographical list of authorities.

Insight into one phase of Japanese character, which receives such contradictory interpretation, is opened by "Human Bullets" (Houghton, Mifflin & Co.), a personal record of experience before Port Arthur by Lieut. Tadayoshi Sakurai of the Japanese army, a young officer who was actively engaged on the Liaotung peninsula until he fell desperately wounded in the general assault of the 23d of August. The military student will acquire little technical information, although there are instructive allusions to equipment, marches, and modes of attack; and the non-military reader may only see how horrible war may be and how destructive to life it actually was in that great campaign. But the essential interest and the real value of the little book is its record of the writer's inner man, not merely of what his bone and flesh and blood and nerves did and suffered, but of his essential personality, perfectly exemplifying that "as a man thinketh so he is." If this were simply the record of an exceptional incarnation of the spirit of patriotic war, one might file it away with that label. But it is neither that nor the Quixotic dream of a solitary enthusiast. It is clearly typical of the spirit which on land and sea animated thousands upon thousands and culminated in the military overthrow of Russia. One need not suppose that the rank and file attained this precise level, but certainly they appreciated and responded with a similar if not identical exaltation of spirit to appeals based upon the same subordination of self. The Emperor called and they esteemed their lives as the dust of the balance. The Western mind appreciates this only in an intellectual way. We do not easily conceive that through pure loyalty, whether to ruler or country, inevitable death or distressing mutilation, without immediate accomplishment in view, can be welcomed in the spirit of sacrifice, or that where the opportunity for such sacrifice may have been accidentally lost then suicide may be a normal testimony to the spirit. It is because of their complete and unresisting surrender of themselves to the controlling moral forces that our author well names his comrades Human Bullets. The story is told for the information and encouragement of his fellow-subjects. It will be read by the Occidental world as a wonderful psychological revelation, in which the vivid inspiration that he draws from the spirits of the departed, conceived to be in immediate touch with the patriotic operations, adds a spiritual factor impressive in itself and new to most of us of the Western world.

It is not a pleasant chapter in the history of European morals which Henry C. Lea has treated in his "History of Sacerdotal Celibacy in the Christian Church" (The Macmillan Co.), but it is an important

chapter, which cannot be ignored by students of ecclesiastical and social institutions, whether in the past or in the present. The marriage of priests has been forbidden by the Western Church since the fourth century, so that the historian has a long period in which to observe the conflict of ecclesiastical authority with one of the fundamental impulses of human nature and note the abuses to which celibacy gave rise. Mr. Lea's study is based upon wide reading in original authorities, including not only decrees of popes and canons of councils, but a large amount of out-of-the-way material in the form of records of tribunals and treatises on ecclesiastical law and practice. Even those who dissent most completely from his conclusions must admit the importance of the evidence which he has collected. Although the greater bulk of the third edition, which has just been published in two volumes, is due in part to the use of different type, the work has grown considerably since its first appearance forty years ago, especially by taking fuller account of the more recent phases of the institution. The revision for the new edition has not been so thorough as the subject deserves, particularly in the matter of utilizing modern monographs on many of the varied topics touched upon in the course of the work, but it is all that Mr. Lea has found time for in the midst of his exacting studies of the Spanish Inquisition, and we must be thankful for what he has given us. The examination of Spanish sources has, moreover, yielded a considerable amount of fresh material, mostly unpublished, notably for the new chapter on solicitation, a carefully guarded field into which insight can be gained only through such a body of material as the records of the Holy Office afford. The proof-reading is not quite up to Mr. Lea's high standard, as when the printer makes him speak of *solicitatio ad turpiæ*. It is a pity that references are still given to antiquated collections, such as those of Baluze and Migne, in cases where the texts cited are to be found in more correct and more accessible modern editions.

Two new volumes have been added to the series of Original Narratives of Early American History (Charles Scribner's Sons). The first, constituting the first volume of the series and edited by W. L. Grant, Beit lecturer on colonial history in the University of Oxford, contains the voyages of Samuel de Champlain, 1604-1618. The second, constituting the fifth volume and edited by President L. G. Tyler of the College of William and Mary, contains thirteen narratives of early Virginia. Mr Grant's work as editor of the Champlain voyages has been well done. The text is that of Slafter, and many of the notes of that admirable investigator have been taken over in part or in whole. The editor has, however, made many annotations of his own. He has called especial attention to the value of Champlain's description of New England as furnishing what Winsor has called the first "intelligible cartography of the shore line of Nova Scotia and New England"; and, notwithstanding Winsor's inclination to regard Champlain's comments as "far less satisfactory" than those of Hariot and White for Virginia, Mr. Grant insists that Champlain did more than any other of the early seamen to bring order out of confusion:

While the trials of the settlements at Plymouth and Massachusetts are known to every schoolboy, the connection of Champlain with the history of the United States has often been disregarded, and he has been considered solely as the founder of Quebec. The exclusive attention paid to the English colonists has glorified Massachusetts at the expense of Maine, and one of the noblest names in the history of exploration has been passed over.

President Tyler's volume offers little opportunity for comment. The narratives are all familiar to students of early Virginia history—Percy's "Observations," Smith's "True Relation," "Description of Virginia," and "General History" (Fourth book), De-La-Ware's "Relation," the letters of De Molina, Father Biard, John Rolfe, and John Pory, the Proceedings of the Virginia Assembly (1619), the Virginia Planters' Plea in answer to Butler's Unmasking, and, lastly, the Relation of the Assembly in 1624 and the Discourse of the Old Company. It is noteworthy that nothing, except a facsimile, is given from the Records of the Virginia Company and nothing at all from Strachey. The prefaces of the editor are sufficient, but the annotations seem slight. The most conspicuous feature of the reprint is the careful and accurate collation of the various texts with the printed originals in the Library of Congress, and the reproduction of a particularly fine copy of Smith's map of Virginia—the seventh "state" in Wilberforce Eames's classification, which "contains more data than any of the other six and differs in no significant way from the eighth." President Tyler believes that the report of the assembly of 1619 was written by the speaker, John Pory, and not by the clerk, John Twine. It would be interesting to know whether this statement is based on a comparison of handwritings or on the endorsement on the original manuscript, which reads, "Mr. Pory out of Virginia," a phrase which may merely refer to the fact that Pory sent over the report. Unless the original report is much misplaced among the Domestic Papers, President Tyler is certainly wrong in assigning it to "James I., Vol. I.," which concerns the first part of the year 1603. The reference probably should be to Vol. 109, which contains letters and papers covering the months of May, June, and July, 1619. The Assembly met on June 30 of that year.

The second series of Renan's "Cahiers de jeunesse" has been issued by Calmann-Lévy.

Romain Rolland, the art professor at the École Normale, who writes the interminable romance of the musical development of Jean-Christophe, reappears as an historian with compact lives of Michael Angelo and Beethoven. These little volumes are based on recent researches, which, in the case of Michael Angelo at least, have completely renewed the face of biography. M. Rolland adds his own striking conception of the unity of the lives which he treats, not as a populariser, but as a scholar and thinker.

Pierre de Bouchaud, who has written poetry in his time and has since devoted himself sedulously to Italian sculpture, now publishes a small volume aiming at a certain literary completeness on "Goethe et le Tasse." It comprises a life of Tasso, with glimpses of his sentimental existence in connection with the "Jerusalem Delivered"; Ferrara in Tasso's day; and Goethe's tragedy, plus a bibliography.

Those who care for the personal side of their philosophers and seek to know how they reached their precise angle of vision will be interested in the little book of Gaston Rageot "Les Savants et la philosophie." It deals with Herbert Spencer, Henri Poincaré, and H. Bergson, the professor of the École Normale, who has acquired so much influence over the younger and somewhat weary philosophic thought of France.

A work of serious erûdition, in an historical field not yet competently covered, has been begun by Camille Jullian, professor at the Collège de France. The first two volumes of his "Histoire de la Gaule" are only the beginning. They deal with the Gallic invasion and Greek colonization, and with independent Gaul. Four other volumes are to follow: the Roman conquest and first Germanic invasions; government by Rome; Gallo-Roman civilization; and the Lower Empire. In the first volume there is a full treatment of two interesting questions—the Greek foundation of Marseilles and Hannibal's crossing of the Alps.

"Les Maîtres du roman espagnol," by F. Vézinet, is a convenient book on a subject of timely literary interest. "Le Pérou contemporain," by Fr. Garcia-Calderon, with a preface of Prof. Gabriel Séailles, a Paris sympathizer with all young nationalities, is a history of the "Peruvian Renaissance."

"Zehn lyrische Selbst-Porträts" is the title of an engaging little volume among the new German books brought over by G. E. Stechert & Co. of this city. It contains portraits of the authors, Ferdinand von Saar, Felix Dahn, J. Trojan, Martin Grife, Detler von Liliencron, Gustav Falke, Arno Holz, R. Dehmel, Otto Julius Bierbaum, and that veteran dramatist, Ernst von Wildenbruch, all drawn on stone direct from life. In addition there is a facsimile of an autobiographical sketch from each writer—a collection of nervous German orthography. There are also selections from each author's works.

Fortunate if not always happy is he who can see himself as others see him. So evidently thought Karl Eugen Schmidt, when he prepared his "Deutschland und die Deutschen in der französischen Karikatur seit 1848" (New York: G. E. Stechert & Co.). Ninety reproductions from French illustrated journals are given to show something of the mood of the French toward the Germans from the time of the Revolution of '48 to the year 1906, but the exhibitor posts a notice in his gallery warning the observer not to take things too seriously. Bismarck and the Prussians are, of course, "hung on the line," and very clever are some of the sketches of Daumier, Cham, and others. No one escapes—not even the Emperors themselves, and *Dienstmädchen* and *Student* are also not beneath the notice of the artist. Particularly amusing is a cartoon of 1864, in strange contrast to the situation today, showing some German soldiers blowing on toy ships in a washbowl, and entitled "Prussia Striving to Become a Sea Power." Notable also is a black-and-white picture, "In Berlinstrassen," where everybody—soldier, officer, and policeman, the old and the young, Germans and monocled Englishmen—skips along to Prussian military step.

How great a service Helene Simon has sought to perform for poor and ailing children can only be estimated by a careful perusal of her book, "Schule und Brot," imported by Stechert & Co., New York. Inspired by Hauptmann's pointed question, "Hast du Speise zu essen, wenn's dich hungert?" the author has tried to learn to just what extent children in the leading countries of the world, who are compelled to attend school, are also forced by poverty to wend their way through heat and cold, and sit long hours endeavoring to grasp the hard facts offered by the teacher while they are hungering and thirsting for bodily nourishment. The book contains a discussion in general of *Schulspeisung*, a specific investigation of the question in Germany, a report on the operation of the school-canteen in France, and a review of the wretched conditions in England, and the means taken by the English government to meet the situation. The showing is, at best, disheartening, and one can sympathize with the author in her imperative demand: "Zuerst Brot, dann die Schule!" Again and again in the reports from various cities of Great Britain, France, and Germany it is proved that children come to school without breakfast, and often go without either breakfast or dinner. Nor does the writer spare her own country; rather, she makes out the conditions there worse than elsewhere, although, as a matter of fact, much has been done in the Fatherland toward supplying poor school-children with coffee and other nourishment.

Prof. Albert Erhardt, leader in the newly established Catholic theological faculty at the University of Strassburg, has, since the publication six years ago of "Der Katholizismus und das 20 Jahrhundert," been regarded as perhaps the ablest and most scholarly of Catholic university men in Germany. The central proposition of Erhardt's work, namely, that Catholicism correctly understood is perfectly consistent with fair and honest independent research, is made again, in a somewhat modified form, the fundamental idea in his recent work "Katholisches Christentum und moderne Kultur," which he publishes as a *Programmskizze* in the Kirchheim collection under the general title Kultur und Katholizismus. The discussion is characterized by a frank criticism not only of what the author holds to be the weaknesses of modern civilization, but also of the objectionable features in the life of the Catholic church. He contends especially that between faith and real science (*Wissen*) there can be no conflict; but his criticisms of the church do not go so far as those of other writers in that church, *e. g.*, Dr. Karl Gebert of Munich, in his work published some months ago, "Katholischer Glaube und die Entwicklung des Geisteslebens." The independence of this school of Catholic scholars was publicly recognized not long since by Professor Harnack in his university address pleading for a better understanding between the Protestants and the Catholics of Germany.

In the work of Pastor L. Couard, entitled "Die religiösen und sittlichen Anschauungen der alttestamentlichen Apokryphen und Pseudepigraphen," a reasonably successful attempt has been made to analyze the theological contents of that remarkable body of Jewish literature which fills the gap between the Old and the New Testaments. The ideas embodied in this literature go far toward making clear the historical background of the New Testament and explaining the religious atmosphere in which the New Testament writers lived and moved. The special topics considered are Theology, in the narrower sense; Angelology; God in His Relation to the World; Man and Sin; Ethics; the Messianic Expectations; and Eschatology. The Introduction is devoted to a discussion of the sources. The investigations are marked by a positive yet fairly critical spirit. The publisher is C. Bertelsmann, Gütersloh.

Under the common title Fortids Sagn og Sange (Myths and Songs of the Past), Prof. Kr. Nyrop of Copenhagen has started the publication by the Gyldendalske Boghandel of a series of popular monographs on legendary, fabular, and mythical traditions. The first number of the series, entitled "Tove's Magic Ring," deals with the highly poetic love episode between King Valdemar and his beloved Tove, which several of Denmark's greatest poets and composers of modern times—notably Holger Drachmann and J. P. Jacobsen—have celebrated in verse and music. Professor Nyrop shows how the tale of the ring and of the unnatural love aroused by it has been applied to various historical personages, Charlemagne, Harold the Fairhaired, etc. He comes to the conclusion that the tale of Harold's all-absorbing love for the Finn girl Snaefrid was taken up by tradition and applied first to Charlemagne and then to the Danish Valdemar, as well as to several other kings and heroes. Even this prototype of the legend he does not regard as historical, but, following the lead of the Norwegian folk-lorist Moltke Moe, he thinks that the old popular tale which is represented by Grimm's "Schneewittchen," has been applied to the uxorious old Norwegian king Professor Nyrop is an entertaining writer, who combines learning with poetic appreciation. His book, while popular, is a valuable contribution to the literature of Danish folk-lore.

The publishing house of Albert Bonnier in Stockholm has begun an undertaking that deserves special attention in this country, where so many patrons of public libraries are of Swedish nationality or descent, namely, a collection, in not less than twenty-five volumes, of the best and most significant of Swedish literary productions from the last four centuries. Sveriges Nationallitteratur, as its name is, was planned by the late Oscar Levertin, and will now, after his untimely death, be edited by Henrik Schück and Ruben Gibson Berg, with the assistance of a number of other critics for the individual volumes. The two volumes with which the publication has begun are devoted to the prose writers of the eighteenth century: Dalin, Linné, Kellgren, Thorild, Ehrensvärd, and others; and to two living authors: Per Hallström, whose exquisite short stories in a decidedly minor key have won him many admirers, and E. A. Karlfelt, whose three or four volumes of characteristic verses have gained for him, though young in years and modern in point of view, an election to the Swedish Academy. The price, only two kroner a volume, is very moderate. Swedish publishers at present seem to vie with each other in issuing cheap editions of both standard and modern works, cheap, it should be said at once, in price only. Bonnier includes in his collection, De Bästa Böckerna, works by Strindberg, Bellman, Selma Lagerlöf, Per Hallström, C. J. L. Almquist, and others. Wahlström & Widstrand, the latest arrival in the field, opened the list of their Kronböcker with K. A. Forslund's "Storgården," a recent exponent of the "back to nature" movement, which here reaches its fourth edition. Aktieboleget Ljus, to which firm belongs the honor of having introduced this class of inexpensive volumes, has already a respectable list, among which are many books issued by arrangement with the original publishers; their latest issues include a new edition of Strindberg's classic "Svenska öden och äfventyr," which here contains that strange gipsy story, "Tschandala."

Kristian Settervall's "Svensk Historisk Bibliografi, 1875-1900" (Stockholm: Norstedt), is a valuable contribution to bibliographical literature. Not less than 4,636 books and articles are here enumerated, dealing with Swedish history in its broadest aspects, including such contributory sciences as numismatics, heraldry, church history, history of education, law and literature, topography and biography; territories that at one time or another belonged to the Swedish realm are also included as far as those periods are concerned. The book has a full author index, but unfortunately there is no index of topics.

A new part of J. A. Almquist's "Sveriges Bibliografiska Litteratur" has appeared, issued in the *Handlinger* of the Royal Library of Stockholm, and also separately (Norstedt); it covers the history of public libraries in Sweden proper.

L. Bygdén's "Svenskt Anonym- och Pseudonym-Lexikon," published at the expense of Svenska Litteratursällskapet in Upsala, has reached the letter O. It is a mine of information, not merely for Swedish literature, but for other literatures as well, as far as translated into Swedish. *Samlaren*, the organ of the above-mentioned society, though chiefly devoted to literary history, contains not a few ramifications into the domain of bibliography, *e. g.*, I. Collijn's series of articles on Swedish libraries and their owners, during the middle ages.

The eightieth anniversary of Pasquale Villari was celebrated at the Laurentian Library, Florence, on November 3, the chief address being made by Guido Biagi. As a permanent and valuable souvenir of the celebration we have Francesco Baldasseroni's illustrated pamphlet, "Pasquale Villari, Profilo Biografico e Bibliografia degli Scritti." The memoir is of the discreet order, bearing chiefly upon Villari's public career as historian, teacher, and publicist. The bibliography, which comprises 407 items, gives a remarkable picture of an intense and varied production. Beside the famous biographies of Savonarola and Machiavelli and the researches in older Florentine history, with all their preliminary stages and accompanying polemics, we have an unbroken chain of journalism for more than fifty years, centring about the notable letters on conditions in Southern Italy, "Lettere Meridionali." Here are as well the indications of Villari's debates

as deputy and senator, and the laws introduced by him as minister of public instruction. The list abounds in items that attest the wide range of his interests. We may select a review of the memoirs of Margaret Fuller-Ossoli (1857), critiques of Taine's writings on art, and even occasional notices of exhibitions at Paris, Florence, and elsewhere. In all it is an extraordinary record of what the Italians, in a word we lack, call fruitful operosity.

The twentieth annual meeting of the American Economic Association will be held at Madison, Wis., December 28 to 31. The programme includes the following papers and discussions: "Are Savings Income?" Irving Fisher, Yale, followed by Winthrop M. Daniels, Princeton; Frank A. Fetter, Cornell; Fred M. Taylor, University of Michigan, and Herbert J. Davenport, University of Chicago; "Agricultural Economics," Thomas N. Carver, Harvard; "The Railway Question," Balthaser H. Meyer, University of Wisconsin; "Money and Banking," Davis R. Dewey, Massachusetts Institute of Technology; "Agreements in Political Economy," C. B. Fillebrown, Boston; "Social Classes in the Light of Modern Sociological Theory," Lester F. Ward, Brown; "The Principles of Governmental Control of Business," Jeremiah W. Jenks, Cornell; "Economic Theory and Labor Legislation," Richard T. Ely, University of Wisconsin; "The Normal Work Day in Coal Mines," Thomas K. Urdahl, Colorado College, followed by Charles P. Neill, United States Commissioner of Labor; "The Working Conditions of Stokers on Transatlantic Steamers," Mrs. Florence Kelley, New York, followed by Miss Emily G. Balch, Jamaica Plain, Mass.; "A Programme for Social Legislation with Especial Reference to the Wage-Earner," Henry R. Seager, Columbia University; "Workingmen's Insurance in Illinois," Charles R. Henderson, Chicago; "The Relation of the Federal Treasury to the Money Market," Frank G. Vanderlip, vice-president National City Bank, New York city, followed by David Kinley, University of Illinois; Joseph French Johnson, University of New York, and Charles A. Conant, New York city; "Public Service Commissions," Senator William H. Hatton, New London, Wis., followed by Hon. Thomas M. Osborne, Auburn, member New York State Public Service Commission; Senator George B. Hudnall, Superior, Wis., and John H. Gray, University of Minnesota. Some of the sessions, as the titles of the papers would indicate, are held in connection with the American Sociological Society, the American Association for Labor Legislation, and the American Political Science Association. The American Historical Association holds its meeting at the same time and place.

The Rev. Theodore Francis Wright, dean of the New Church Theological School of Cambridge, Mass., died November 13, on his way to Egypt, to make archæological investigations. He was born in Dorchester, Mass., in 1845, was graduated from Harvard in 1866, and then entered the New Church Theological School, at Waltham. His course of study at Harvard had been interrupted by service in the Union army in 1864-5 as first lieutenant. He was ordained to the Swedenborgian ministry in 1869, and after twenty years became dean of the school at Cambridge. He was also editor of the *New Church Review*, Boston. He wrote several books, among them, "The Realities of Heaven," 1888; "Life Eternal"; and "The Human and Its Relation to the Divine," 1892. Dr. Wright was prominent in archæological studies; was authorized lecturer of the Palestine Exploration Fund, and its honorary general secretary for the United States; a member of the Archæological Institute of America, of the American Oriental Society, and of the Society of Biblical Literature and Exegesis.

The Rev. Alexander Stevenson Twombly died November 19 in Newton, Mass. He was born in Boston in 1832, and after study at Heidelberg, Germany, he was graduated from Yale in 1857, and a year later from Andover Theological Seminary. He held pastorates in Congregational churches in Cherry Valley, N. Y.; Albany, Stamford, Conn., and Boston. Dr. Twombly was author of a number of books, including "Merry Maple Leaves," 1872; "The Choir Boy of York Cathedral," 1890; "Masterpieces of Michael Angelo and Milton," 1896; "Life of Dr. John Low," 1896; "Hawaii and Its People," 1900; "Kelea, the Surf Rider," 1900. He was also for two years literary editor for Silver, Burdett & Co., and editor of the Silver Series of English Classics.

Gen. Sir Henry Edward Colvile died November 24 as the result of an automobile accident. Gen. Colvile was born in 1852. From 1880 to 1883 he served as aide-de-camp at the Cape, and later in different grades in the Sudan, Egypt, and Burma. In the South African war he commanded the Guards Brigade and the Ninth Division, but, with other officers, was recalled. He was the author of the following books: "A Ride in Petticoats and Slippers," "The Accursed Land," "History of the Sudan Campaign," "The Land of the Nile Springs," and "The Work of the Ninth Division."

The death is announced from his château of Écotay, near Montbrison, of Marie Camille, Vicomte de Meaux. He was born in 1830, and married a daughter of Montalembert. Under Marshal MacMahon he was prominent in French politics, and he was a member of the Duc de Broglie's Ministry of 1877. His royalist opinions, however, withdrew him from public life in later years, and he had devoted himself to historical writing. Among his books are "La Révolution et l'Empire," 1877; "Les Luttes religieuses en XVI siècle," 1879; "La Réforme et la politique française jusqu'au Traité de Westphalie," 1889, a work crowned by the French Academy; "Église catholique et la liberté aux États Unis," 1892; and "Montalembert," 1892.

The death is announced of Dr. Konrad Zacher, professor of classical philology at the University of Breslau. He was born in 1851 at Halle. He is the author of a number of works on his specialty, including "De Nominibus Græcis in -αιος," 1877; "Aussprache des Griechischen," 1888; "Die Handschriften und Klassen der Aristophanes-Scholien," 1888; "Aristophanes Studien," 1898; "Parerga zu Aristophanes," 1899.

BOOKS FOR CHILDREN.—I.

The reviewer of children's books may judge of the present output by his knowledge of the past. He finds, for one thing, that what was started as a story last year, is being continued as a series this. A. F. Johnston's "The Little Colonel" (L. C. Page & Co.) sounds familiar to his ears; Anna Chapin Ray's young heroines have appeared in other places besides New York; the inmates of Marion Ames Taggart's "Little Grey House" (The McClure Co.) are old friends. This same reviewer, accustomed to the formula which authors seem by instinct to adopt when they tell a college story, finds little difficulty in unravelling the plots of such tales as Ralph Henry Barbour writes. But among the hundreds of "juveniles" issued this season a number are above the average and are worth a passing note.

As a companion to their "Posy Ring" and "Golden Numbers," Mrs. Kate Douglas Wiggin and her sister, Nora Archibald Smith, have gathered a book of rhymes for the nursery, which they have named "Pinafore Palace" (McClure). The title is a pleasant one, and suggests the definition E. V. Lucas gives for a child's book: to afford the playroom a good time. This volume of jingles is judiciously divided, somewhat like Charles Welsh's edition of "Mother Goose," to accord with the physical activities and dawning mental appreciation of small folk. There is a diversity of selection, ranging from "Pussy-cat, pussy-cat, where have you been?" to Tennyson's least childlike and most stilted poem, "Minnie and Winnie." Taken in a set, these three volumes of verse represent an agreeable progress from classic jingle to rarest poetry. Equally attractive in title is "The Golden Staircase" (G. P. Putnam's Sons), another collection of poems for children, made by Louey Chisholm, consisting of two hundred and fifty steps in the mount. Unfortunately, these steps are not of the same excellent seasoning, nor are they of the same height. There is a random choice and a random arrangement; some inclusions of historic interest, other inclusions of undoubted beauty; but between them there is a depression of the mediocre: "How doth the busy little bee" in the same volume with "Oh, Captain, my Captain"; Jane Taylor's "Thank you, pretty cow" keeping company with "Sir Patrick Spens." The volume is large and sumptuous. Had E. V. Lucas considered twice, he might have struck from his "Verses for Children" (The Macmillan Co.) a great deal of material which is of interest to the general student, but of little appeal to present-day juvenile readers. He has adopted Mrs. Wiggin's method of dividing his poems into sections with fanciful titles, such as "Friends in the Village," "Little Fowls of the Air," and "Ballads of Dumb Creatures." In the midst of poems which pleased our grandparents are to be found that lighter verse written by our contemporaries. But a child will have to hunt out what is of interest. In form, the volume is fresh and dainty, reminding one very much of the compiler's former collections of "Forgotten Tales of Long Ago" and "Old-Fashioned Tales." Of more scholarly pretensions than Mrs. Wiggin's collection is S. Baring-Gould's "A Book of Nursery Songs and Rhymes" (A. C. McClurg & Co.). There is a short dis-

criminating introduction, and ten pages of historical notes. The decorative borders on every page are so deep and black that one regrets more the absence of white margins.

Many readers look back upon their well-thumbed "Arabian Nights" with a distinct pleasure; they would rather read of Aladdin from a volume of fine print, with crude woodcuts of heroes in baggy trousers and heroines wearing filmy veils, than from the most gorgeous edition. No one, however, can deny attractiveness and richness to E. Dixon's "Fairy Tales from the Arabian Nights" (Putnam), which he has edited and arranged from the version based on Galland. He has been fortunate in securing as an illustrator such a man as John D. Batten. It is a relief to read again a text that has literary charm and construction; and the volume deserves warm recognition. E. P. Dutton & Co. have another volume of the "Arabian Nights," containing five or six of the best-known stories edited by W. H. Rouse and illustrated in color by Walter Paget, altogether one of the most attractive books of the season. It makes one feel not a little proud, when one's own ideas regarding favorite fairy tales are backed by the intellectually élite of the country—not that Charles Perrault or Hans Christian Andersen or Grimm need any support in their claim to immortality. Harper & Brothers have issued a tempting looking book in white covers, with illustrations by Peter Newell, which they have entitled "Favorite Fairy Tales"—being the childhood choice of representative men and women. There is a certain humor in learning that Henry James has clung to "Hop o' My Thumb"; and that William Jennings Bryan, backed by Miss Jane Addams, has given the palm of excellence to "The Ugly Duckling." This feature of the book is the least valuable, even though the method of selection might form the basis of an amusing article. The fairy tales are all undoubtedly classic, and the judges are to be congratulated on their taste. Andrew Lang, of course, adds another to his long list of colored Fairy Books. This time the tint is Olive (Longmans, Green & Co.). In a pleasantly written preface Mr. Lang tells how the reading and writing of fairy tales came into fashion in modern Europe. The stories in this volume come from various sources, including Turkey, Armenia, India, Denmark, and France. The admirable illustrations, including eight plates in color, are, as usual, by Henry J. Ford. J. B. Lippincott Co. issues an edition of an old favorite, George Macdonald's "The Princess and the Goblin," with illustrations in color by Maria L. Kirk, together with the original wood-engravings after Arthur Hughes. This, perhaps the most popular of Macdonald's stories for children, was first published in 1871, and it has since been frequently reprinted on both sides of the Atlantic. The type of the present volume is large and clear.

Three books of ample and uniform size have been issued by the Frederick A. Stokes Co., under the general title of the Dandelion Classics. One of these has come to the reviewer's table before—"Robin Hood," whose adventures are told in the original ballad form, the selections and illustrations being made by Lucy Fitch Perkins. The book shows good taste, and the illustrations—most of them done in color—are simple in outline and excellent in spirit. Miss Perkins has likewise illustrated "The Twenty Best Fairy Tales"—taken from Andersen, Grimm, and Miss Mulock. The stories are some of our best known, and the pictures simple in execution. The final volume is "A Midsummer Night's Dream," adapted for young people from the Cambridge text. It is introduced by a story called "In the Days of Shakespeare," in which Will's brother Edmund—come to London Town—tells of the actors, and of their playing before the Queen. Miss Perkins again illustrates the scenes, and her color work is highly successful in humor and imagination. Especially happy in execution are the end papers, which in outline represent the characters of the play. A familiar-looking volume is "The Story of Sir Launcelot and His Companions," by Howard Pyle (Charles Scribner's Sons), told in text and pictures. This is a companion to the former volumes dealing with the Round Table, and it follows the original closely in spirit. In the re-telling of Malory, there is always a loss of spirit and of ruggedness, however sincere the effort may be; and it takes a genius equal to Malory's own to rewrite him. Not that we question Mr. Pyle's work, for it is far superior to the average attempt; but we look askance at the general method of adaptation, such as that pursued by J. Walker McSpadden, in his "Stories from Chaucer" (T. Y. Crowell & Co.). We have commented before upon the excellent series in which this small volume appears. The publishers have done themselves credit by the variety and excellence of titles they have included; but, when one re-tells the Canterbury Stories, adding to them material which is not part of them, the result is of doubtful value. Mr. McSpadden's introduction is in many ways worthy, and he shows a sincere effort to retain the spirit of the master genius.

CURRENT FICTION.

Arethusa. By F. Marion Crawford. New York: The Macmillan Co.

We note that this story has been hailed, or announced, in certain quarters, as the best thing Mr. Crawford has done since the Saracinesca series. Some enterprising person must have read all the intervening books. This we cannot say we have done; but we seem to recall several out of the number which are far and away better than this rather perfunctory romance. It is of the popular historical type, great names and times used for purposes of color and costume in presenting the usual sentimental and swashbuckling adventures. Of course Mr. Crawford does the trick far better than the ordinary performer; but he never (so far as we recall) quite achieves that last miracle of transmutation by which the dross becomes gold. He is merely, as the author of some thirty-five novels should be, extraordinarily adept, a master of his craft, as a craft.

"Arethusa" is written in a tone of good-humored nonchalance. "The story-teller in the bazaar," as he calls himself, knows what his auditors want, and is content to let them have it. His place is Constantinople, and his time 1376. The two principal characters are Venetians by birth. One is an "ex-clerk, ex-gambler, ex-soldier of fortune, ex-lay prebendary of Patras, ex-duellist, and ex-Greek general"; now a merchant of Constantinople. He is commissioned by an old rascal of a Venetian friend to buy and forward a beautiful young female slave. He applies to a slave merchant, who, as it chances, has just come into possession of an extraordinary piece of merchandise. This is a girl of beauty that is remarkable (except in fiction), a supposed Greek, driven by the last extreme of destitution to sell herself into slavery for the sake of her mother and little brothers. Zeno, the Venetian, buys her in his own name, purposing to transfer the ownership at once to the friend who has given him the commission. This, for reasons which need not be specified, he finds himself unable to do. A bond of political interest presently unites Zeno and the girl, as well as the yet unacknowledged bond of personal sentiment. There follow certain adventures which would be thrilling if the pair did not obviously carry the usual hero-and-heroine insurance against actual calamity. In due time their plans succeed, the lady turns out to be a Venetian of gentle blood, and there is nothing further to detain us. Mr. Crawford is one of the most skilful of entertainers, and it would doubtless be ungracious for criticism to deplore his increasing tendency to lighten the quality of his entertainment.

The Heart of the West. By O. Henry. New York: The McClure Company.

After the intrinsic delicacy and fancy of "The Four Million," Mr. Porter's new volume of short stories is a distinct disappointment. Clever it is; Mr. Porter can hardly fail to be that, but cheaply clever, mistaking grotesqueness for humor, exaggeration for animal spirits, and too often ending in a trick, a cheap surprise. His vocabulary, so agreeable in "The Four Million" and in "Cabbages and Kings," here seems overstocked. His Texan cow punchers talk like intoxicated dictionaries, old-fashioned negro minstrels, and the advance agents of a wild west show. Where his little vignettes of New York teemed with the nicest observation (however comically expressed), the present stories are full of the kind of situation known only to fiction—tramps turned into industrious if playful ranchmen, reclaimed jockeys, long lost fathers. Perhaps the Southwest may really produce these miracles, but if this be true to life, it is to Mr. Porter's over-ornate treatment that his Petes, Curlies, and Bildad Roses owe their theatrical air of improbability.

The whole collection might be taken as an example of how conventional and tiresome the raciest slang may grow, when used in excess, as a means of enlivening flimsy and carelessly conceived commonplaces. If a new young man from nowhere had produced "Telemachus' Friend," or "The Seats of the Haughty," the stories might have passed as faintly amusing and as possessing a certain vitality. But judged by the standard of his own work, by that delicate prelude to "The Green Door" with its happy and charming imagery, Mr. Porter has fallen upon a moment of reaction when instead of growing into a more genial Maupassant (as we all hoped), he has lapsed into a mixture of fables in slang

and stock melodrama. It is not credible that so individual and delightful a talent should be so soon spent. At a time when such quality as he has shown is rare, Mr. Porter must take that talent a trifle more seriously.

In High Places. By Dolores Bacon. New York: Doubleday, Page & Co.

After her taking skit, "The Diary of a Musician," Mrs. Bacon has reached that point so fateful to American novelists, the parting of the ways, where her next novel must definitely decide whether she is to develop further, or rest content with an active invention and a fairly fresh way of putting things.

"In High Places" deals with the typical American husband of the kind who makes millions untold for his wife to squander, receiving little or nothing in return. Contrasted with this unfair division of labor, the family of his partner, the Jewish banker, stands in happy relief. Indeed, the best touches throughout—even if verging upon caricature—lie in the domestic scenes between Wolfschön and his "Peeckie." The two sentimental German musicians, with all the qualities of Col. Newcome (of brain and heart) plus sausage and perpetual beer, are overdone, and too loosely knit into the story. The melodrama, with which their episode ends, strikes too violent a note, not, perhaps, for real life, but for a book of this kind. Nevertheless, the story shows more ability than the average novel, and an unexpected turn of phrase often whets the interest in perfectly commonplace matters.

The greatest surprise in the book, however, is brought about rather by deliberately misleading the reader than by deft manipulation of events, and this method of mystification is hardly legitimate. On the other hand, the scene where Rosalie refuses to divorce Drayton shows both power and imagination. The financial dealings, the Copper Trust, the failure of Hulot, are all kept well within bounds; while enough is told to set the machinery in motion, the reader is mercifully spared the tiresome minutiæ of business. This book can therefore be classed as a description of the way in which certain people lived their lives, not as the history of a copper deal incidentally involving the evolutions of a few standard puppets. "In High Places," in fact, inspires a hope that Mrs. Bacon may go on rather than back, that she may succeed in ridding herself of the shopworn, obvious side of her talent, and by clearing her mind of a residue of stock phrases and characters, leave it free to receive her own unhackneyed and genuine impressions.

Lord Cammarleigh's Secret. By Roy Horniman. Boston: Little, Brown & Co.

By providing his novel with the sub-title, "A Fairy Story of To-day," the author has protected himself against any charges of improbability. Anthony Brooke, a vagabond actor, penniless, but possessed of clever wits, self-confidence, and unbounded ambition, wanders dejectedly through the rainy streets of London, until the never-failing golden moment comes to him. He passes close to the Marquis of Cammarleigh, catches the hunted look in his eyes, knows him for a coward, and, under a supreme impulse of audacity, taps him on the shoulder and observes, "I know your secret." Through the hold that this pretended knowledge gives him over the rebellious but easily terrorized marquis, Anthony establishes himself as private secretary and superintendent in his victim's ill-managed household; brings about economy and system where all had been anarchy; smooths out Lord Cammarleigh's social relations; wins his respect, if not his friendship; and, by sheer impudence, gains an introduction for himself into the most aristocratic circles of London. Eventually he is chosen member of Parliament from Cammarleighburgh, and wins the hand of the beautiful niece of the marquis. One may question the ethics of these transactions, even in a fairy story; but Anthony is a blackmailer of too droll and amiable a type to allow one to be greatly offended by his unwarrantable successes.

The Mediator. By Edward A. Steiner. New York: Fleming H. Revell Co.

In spite of faults of literary style, this novel is of unusual interest because of the scenes in which the action takes place. The story begins in Russian Poland and describes in a graphic way an anti-Semitic persecution. In consequence of the danger and suffering to which they were exposed, the principal characters emigrate to New York, and the author gives a realistic account of their life in the Jewish quarter. The book is evidently intended as an eirenicon to compose the differences of Jew and Gentile. Unfortunately the attitude taken with respect to both Christianity and Judaism is not of a kind to enlist the sympathy of the adherents of either creed. Where prejudices exist on the part of Jew or Christian, the cause is racial rather than religious; and Mr. Steiner, who is apparently a convert from the older faith, seems to underestimate the real difficulty which divides the Christian from the people who have given him the source and principle of his religious life.

The realistic parts of the narrative contain many offences against good taste; and these are the more to be regretted because the conception of the author is original, and he writes at times with dramatic power.

The High and Puissant Princess Marguerite of Austria. By Christopher Hare. Illustrated. New York: Charles Scribner's Sons. $2.50 net.

If only for Matthew Arnold's sake we should welcome this volume, since its heroine is the heart-broken widow who built the Church of Brou. It would be pedantic to point out the lapses from strict accuracy which occur in the course of the poem. The chief thing is that the Church of Brou furnishes as fine a subject for elegiacs as can be found—the hope of a life cut short, art brought to the service of true love, and the uplift which springs from an undying loyalty.

So rest, for ever rest, oh princely Pair!
In your high church, 'mid the still mountain-air,
Where horn, and hound, and vassals never come.
Only the blessed Saints are smiling dumb,
From the rich painted windows of the nave,
On aisle and transept, and your marble grave.

The twain of whom Arnold sings thus were, of course, Philibert II., Duke of Savoy, and his faithful spouse, Marguerite of Austria. This princess was born to the Hapsburg line at a moment when its fortunes were about to reach their highest point. The motto of her grandfather, Frederick III., had been A. E. I. O. U.—"Austriæ est imperare omni universo." At the moment of its first utterance, this boast must have seemed to be fantastic nonsense, even on the lips of a holy Roman Emperor. But presently Maximilian married Mary of Burgundy, an alliance from which the European greatness of Frederick's descendants proceeded to spring. Philip, the first child, was born in 1478, and Marguerite, two years later. It only remained for Philip to wed Joanna, the daughter of Ferdinand and Isabella. Then, with the Empire, the Low Countries, and Spain brought into one confederacy, Frederick III.'s vaunt came as near realization as ever swelling words do come.

Mr. Hare, then, is well within the mark when he styles Marguerite of Austria a "high and puissant princess." The daughter of Maximilian, the aunt of Charles V., regent of the Netherlands and Princess Dowager of Spain, she takes rank among the foremost women of the sixteenth century—an age when many women left their mark on politics. Perhaps the clearest light to be shed upon her character comes from her motto, "Fortune, infortune, forte une." In these words, so much nobler than the jingo aspiration of her grandfather, may be seen the guiding star of her life, which was crowded with sorrow, responsibility, and pain of body. Dante's "Ben tetragono ai colpi di ventura" voices the same mood, but it may be doubted whether the Florentine exile had a heavier burden than the Hapsburg princess.

As a biographer, Mr. Hare has not quite learned the art of making political annals subservient to the interpretation of character. One important trait, however, he has raised in high relief. Marguerite was, above all things, loyal. True to her husband's memory, after a fashion almost unparalleled among the grand dames of that age, she was no less true to her father, Maximilian, and her nephew, Charles V. In the "Courtier" Castiglione praises her government of the Low Countries, but it was from no mere love of rule that she filled the regency of that troubled land. Devotion to the family interest ever came before the promptings which more naturally would have made her crave leisure and the life of the soul. Best of all, one can give in her own words the motive which dominated her acts from girlhood to death.

Tousjours loyal, quoy que advienne
En tout et partout l'homs doit estre,
Tant soit il seculier ou prestre;
Droit dit que loyalté l'ou tienne.

Dieu veut certes qu'on s'entretienne
En fortune bonne ou senestre
Tousjours loyal.

Pouser le cas qui mes avienne
Et que le tout ne vient à dextre,
Je ne scay mieux du monde en l'estre
Pour l'homme for qui se mentienne
Tousjours loyal.

Marguerite of Austria is so fine a figure among princesses, showing how "even in a palace life may be well lived," that we have said more for her than of her biographer. Mr. Hare employs good mate-

rials, and keeps well in touch with Marguerite's correspondence, but much of his narrative is trite. This criticism must not he taken as wholesale depreciation, for it is a hard task to make princesses of the sixteenth century live again. Even Mary Stuart is a wooden personage in the hands of the generality, however gorgeous may he the adjectives employed. Mr. Harc has written a hook which at the lowest appreciation is creditable. If at times his drawing is somewhat commonplace, it is hecause he has attempted a difficult form of portraiture. To he more categorical, our worst censure is directed against a style of composition which the following sentence will illustrate:

Poor lady! She can scarcely have expected a happy life as the wife of a prince on whom she was thus forced; an unwilling bridegroom, who had frittered away his affections on many ohjects, and was now entircly devoted to Mademoiselle d'Heilly, soon to become Duchesse d'Etampes, and his queen in all hut name.

The Idylls and the Ages. By John F. Genung. New York: T. Y. Crowell & Co. 75 cents net.

Inquiries and Opinions. By Brander Matthews. New York: Chas. Scribner's Sons. $1.25 net.

Great Writers. By G. E. Woodberry. New York: The McClure Co. $1.20 net.

Those readers who care for the academic exegesis of poetry will douhtless find much that is stimulating in Prof. John F. Genung's "The Idylls and the Ages," a hooklet upon Tennyson's Arthurian cycle. Despite an ornamental, hardly legible page of type, and a correspondingly precious literary manner that deals with such choicely phrased matters as "Spiritual Dynamic in the Ages Poetry," "Complementary Arcs in the Life Orhit," and "Assessment of Residual Values," the essay will convey the sentiment and ethical implication of the "Idylls" with full fidelity to the earnest seeker. If it docs not succeed in elucidating very clearly or freshly "the central thrust" of the cycle, it does at any rate give us a carefully meditated and elaborately phrased study of its qualities and composition. Our quarrel with it is chiefly for its literary cant and esoteric eloquence, its lack of the prose point of view; a lack that is too frequent in the writings of those preoccupied with the sympathetic "appreciation" of Victorian poetry.

Prof. Brander Matthews's latest volume of essays, "Inquiries and Opinions," is rather refreshing in its candid externality to "spiritual dynamics." The inquiries, which range from "Invention and Imagination" to "The Art of the Stage Manager," and the opinions, which are expressed upon such various suhjects as Mark Twain and Maupassant, are the inquiries and opinions of a writer who is shrewd, clear-headed, well-informed, *au courant,* a craftsman. They are comparatively devoid of temperament, of the discursive touch, of charm; they afford us no unexpected lights or sudden vistas, hut they furnish us many interesting facts and just observations set forth with singular lucidity and coherence.

In his volume of essays on "Great Writers," the peculiar critical genius of G. E. Woodherry is seen to exceptional advantage. The papers have been trained down to an athletic sparcness. There is no quotation, no reference to authority, no rhetorical expatiation. Three great prose writers are treated, and three world poets, Cervantes, Scott, Montaigne; Virgil, Milton, Shakespeare. The short declarative sentence, the keen poetic phrase, these are the materials in which Mr. Woodberry has worked in painting his pictures of the minds of great writers. He approaches high matters with a suhtle simplicity that lends a dignity to the texture of his prose, and reinforces his humane imagination with a singularly concrete and vivid sense of the individuality of historical periods. The essays upon the prose writers are perhaps a little more interesting and satisfactory than those upon the poets. In the latter case Mr. Woodherry is apt to catch a certain fervor from his suhject that tends to make him rather the rhapsodist than the critic. Perhaps best of all is the essay on Cervantes, which is even lighted hy some appropriate gleams of humor, a quality that has not always attended Mr. Woodherry's work. How compact and telling is this summary of the *dramatis personæ* of "Don Quixote":

It is a hook written in Spain as from the centre of the world, and this Spain was filled with its own folk; the race-mark of "the old Christian blood," of dark-skinned Moor and gypsy was stamped on them; they came forth in all their variety of life, hidalgo, bourgeoise, picaresque, ducal, provincial, intellectual, young and old, good and had, soldier, student, and priest, innkeepers, criminals, players, peasants, lovers, highways, barhers, carriers, judges, officials, doctors, menagerie-men damsels, duennas—an endless list. Scarce any book has so many people in it. This mass is put in constant movement, which gives an unwearied liveliness to the scene. It is a hook of life on the road. All the world is *en voyage.* The galley-slaves are there; even the dead are going a journey.

When Mr. Woodberry comes to subtler points of interpretation he is equally pregnant and provocative:

This strange madness of Don Quixote is comic in its accidents, in its circumstantial defeat, in its earthly environment; hut in itself it is tragic. Its seat is in the very excellency of the soul; its illusions take body in the noblest human aims, the most heroic nature, and virtue of the purest strain. A madman has no character; hut it is the character of Don Quixote that at last draws the knight out of all his degradations and makes him triumph in the heart of the reader. Modern dismay hegins in the thought that here is not the abnormality of an individual, hut the madness of the soul in its own nature.

There is a question whether Mr. Woodherry is not preoccupied a shade too much with the tragical aspects of the book, which, after all, must remain for nine readers out of ten, what it was for Hogarth and Fielding and Smollett, the world's great comic masterpiece; yet it is well for the tenth to have so convincing an analysis of the book as "the paradox of idealism."

The France of To-day. By Barrett Wendell. New York: Charles Scribner's Sons. $1.50 net.

Prof. Barrett Wendell hrought hack from his recent trip to France the material for a volume of impressions. He has not, and does not pretend to have, an acquaintance with the French hased upon years of residence, as in the case of Philip Gilhert Hamerton and Miss Betham-Edwards, or upon years of travel like the magisterial Mr. Bodley. On the other hand, his hook is fresher and more vivid than the painstaking and sometimes painful enucleation of French traits hy W. C. Brownell. Professor Wendell made good use of his exceptionally favorable opportunities for observation. The French are slow to admit strangers to their family life, not necessarily, as sometimes suggested, from selfishness, but rather hecause of thrifty habits which have never made entertaining natural or convenient and have limited it to important functions, the Gargantuan marriage feasts of the peasants or the hig dinner at a restaurant of the *bourgeoisie.* When, however, one occupies, as did the author of this hook, a semi-official position, the chances for intercourse, however ceremonious, hecome correspondingly greater; and the opening chapter upon the universities introduces one to a side of French life unfamiliar to globe trotters on their way through France or to the manufacturers of literary guidehooks to the various provinces. From the universities the writer passes to those hroader generalizations of which he is fond upon society, the French temperament, literature, religion, the Revolution, and the Repuhlic.

The universities, as autonomous bodies, are indeed recent creations, though the provincial faculties have vegetated harmlessly for generations. The first glimpse into the world of scholarship opens the eyes of the tourist, who takes the Frenchman for a loiterer, and who judges him hy an occasional Latin Quarter students' effervescence. Industry is unremitting, in school through discipline, and in the higher studies through competition. Thus the danger which the French scholar must avoid is quite as much that of hecoming a *rat de bibliothèque* as a *fâncur.*

The American academic missionary apparently received a cordial welcome everywhere, and the rose-colored impressions which he experienced seem to have permeated his vision of French life and character. Every nation has some hlot upon its scutcheon, and that of France is so conspicuous and so openly flaunted hy the French themselves to the world, that it is well to hear a defender speak for them. Explanation is, however, only partial excuse. It may give some satisfaction to know that the hitter hostilities which justify the saying, *Gallus Gallo lupus,* and have made French political life unspeakahle, are due to excessive indulgence in *a priori* reasoning; it is an intellectual soothing syrup, rather than a moral gratification, to hear that the French novel and drama do not represent life and that France is full of happy homes. This explanation does not make French political life more endurahle or French fiction more palatahle. The Frenchman's judgment of a hook is entirely intellectual, and concerns its value as a work of art without moral prepossessions. But a whole literature cannot be unrelated to a national life, in the portrayal of which even the sedate and Protestant *Temps* would often be ahle to make the British matron stare and gasp.

The chief explanation of so-called French immorality lies in the fact that the influence of woman hegins only with marriage. Nohody charges French women with heing

immoral, and M. Brieux, in his recent play, "La Française," set up a man of straw in his American who could not believe in their virtue. Our own society may be over-feminized, as critics maintain: the Frenchman never fears social ostracism from the time he is released from school and family discipline until marriage, however contrary to moral convention his conduct. French women have themselves to blame for not exacting from men a stricter reckoning.

An important merit of Professor Wendell's study lies in his realization of the fact that the French temperament is essentially a logical one, and has been so ever since scholastic philosophy made its home in the rue de Fouarre. The Frenchman determines a course of action by *a priori* reason, and carries it to its conclusions regardless of other facts or theories. It was in the name of ideals of humanity that the murders of the French Revolution were perpetrated by a "sea green incorruptible"; it was in the belief that the legal *chose jugée* should be maintained that Dreyfus, guilty or not, was to be left to die in exile. Literature, therefore, becomes a vehicle chiefly for the enunciation of theories. M. Brieux, in one of his most notorious plays, does not even give individual names to his characters; poetry tends to be the embodiment of some symbol, the epic perished in the classical age under the weight of allegorical moralizing; and criticism often builds magnificent *palais d'idées*, though their foundations totter on the shifting sands of controversy.

Professor Wendell's book is both entertaining and profitable, and can be recommended as an introduction to the study of the French character.

The Spirit of Old West Point. By Morris Schaff. Boston: Houghton, Mifflin & Co. $3 net.

Since the fateful days of the civil war, in whose fiery furnace the graduates of West Point won anew their right to the nation's confidence, there has been no volume which so happily and truthfully pictures the life of the little military colony on the Hudson as that of Morris Schaff. With depth of feeling, a kindly charity, and generous pride, he recites the story of the average boy of his day and generation in his progress through the model of military schools the world over. Scattered through the pages are glimpses of the careers of many of the graduates whose blood has tinged our fields of battle over the wide expanse of a Continent. The author was a cadet when the civil war broke out, and his description of scenes and incidents of those trying days, when some of the lads at the academy were following older heads back to the South to join the Confederacy, throws new light upon an historic era. There are several pathetic descriptions of meetings of opposing classmates and friends on the battlefields and in hospitals. No words of bitterness; each fought for the right as he saw it, fought as became him who had worn the gray coatee under the spreading elms on the bank of the Hudson.

Describing the receipt of his own appointment in an Ohio country district, his journey to and arrival at West Point, the author says:

> The sensations of the new cadet when he reaches the Plain linger a long while. There are two West Points—the actual West Point, and the overarching spiritual one, of which the cadet only becomes conscious about the time when he graduates. The determinate West Point that is to be his master for four years, and the shaper of his destiny, meets him at the top of the slope with ominous silence. He hears no voice, he sees no portentous figure, but there is communicated in some way, through some medium, the presence of an invisible authority, cold, inexorable, and relentless. Time never wears away this first feeling; it comes back to every graduate on returning to West Point, let his years and his honors be what they may. And perhaps it is just as well that it is so; that there is one place left in our country where the vanity of asserted ancestry, and the too frequent arrogance of speculative, purse-proud, and fortuitous commercial leadership find a chill.

To hazing the author refers in much the same spirit that pervades most old graduates who are not on duty at the academy:

> When I reported, it was running full tide, and while it made life sufficiently miserable for me, yet, as I look back over it all, smiles rather than frowns gather. At the risk of being charged as a covert advocate, I must say that it was a mighty leveler in my day; and that the fellow who got it worst and most frequently, if he did not deserve it, at least courted it by some lofty manner of resented witticism. To be sure, sometimes a profoundly rural simplicity, some queer wild look, tone of voice, or manner, would get faithful, if not undue, attention.

The course at West Point has come in for more or less criticism at various periods because of the paucity of literature and history and the excess of mathematics and philosophy. Concerning this argument the author says that the graduates have "worthily met the mighty problems of war." And he holds that West Point "is a great character-builder, perhaps the greatest among our institutions of learning." And it may be that the very bareness and rigor of the course, the neglect of those studies which are supposed to cultivate intellectual grace and amenity, have a direct and potent effect in the development of straightforwardness in character.

Upon this effect of West Point the author dwells at length. He notes among the immediate personal influences which are, so to speak, the initial processes of the spirit of West Point for transforming new cadets into officers, "the stimulating effects which come with wearing the uniform, with the mastery of one's motions in walking, marching, or entering the presence of a superior, with the constant regard to neatness and the habit of scrupulous truth-telling," and he adds:

> Moreover, there is something uplifting in finding one's self among high-minded equals, and in realizing that in your superiors is lodged one of the most important functions of government—the right and power of command. Then, too, the cadet begins to be conscious of the exclusive and national distinction of the Military Academy. Very soon, the monuments, the captured guns, and dreaming colors—which at the outset are mere interesting, historic relics—beckon to him; he feels that they have something to say. Before he leaves West Point they have given him their message, revealing from time to time to his vision that field from which lifts the radiant mist called glory.

It would be easy to quote many more passages in the same tone; a tone which is at times more sentimental than one would expect from the stern man of war. But this very characteristic is a fresh illustration of that warm affection which every one of generous temper feels for the teachers and even the material buildings and grounds of the institution where he experienced his great awakening as his youth flowered into manhood. Without further quotation or comment it is enough to say that this book presents an interesting and vivid description of this discipline, physical, mental, and moral, by which a boy acquires "the ideals of the soldier and the gentleman."

Science.

EXPERIMENTS IN EVOLUTION.

The Zoölogical Society of London has to its credit a long array of scientific Proceedings and Transactions well known the world over, but the Zoölogical Society of our own city, owing to its work of preparing the Zoölogical Park for the public, has thus far published only its *Bulletin*, popular in nature, and the quasi-scientific articles in the Annual Report. Vol. 1, No. 1 of *Zoölogica*, the scientific publication of the society, hast just appeared, containing a forty-page article on "Geographic Variation in Birds, with Special Reference to the Effects of Humidity," by C. William Beebe, curator of birds. The article is based on experiments carried on with living birds, at the Zoölogical Park during the past six years. The results are of considerable interest, especially from the point of view of evolution and the external factors which influence the formation of species. This field of experiment is almost untouched, and if future research yields as unlooked-for results as are detailed in this article, it will prove well worth cultivation.

It has been known for years that many mammals, birds, and reptiles inhabiting a humid region show a much darker coat, or increased pigmentation of the hair, feathers, or scales, than do individuals from dryer localities. In fact, subspecies and full species are often based on such characters as these. In a wild state the wood thrush varies but slightly, being a highly migratory bird. In humid Guatemala, however, the spots on the breast of these birds are said to be of unusual size and color. In one of Mr. Beebe's experiments three normally colored young wood thrushes were taken from a nest in the spring of 1902, and reared by hand. One was confined in a humid atmosphere, where it lived until August 20, 1904. This bird had become radically different in color from its fellows, especially on the breast and sides. The dark spots had increased greatly in size, in some places becoming almost confluent. The wing and tail feathers, on the contrary, showed marked albinism.

The white-throated sparrow is like the thrush, in showing little or no geographical variation in a wild state. Two of these sparrows were trapped from the same flock in October, 1901, both young males. One was kept outdoors under normal conditions, and the other confined in a super-humid atmosphere. In October, 1904, after the winter moult was completed, both birds were chloroformed. The former is in perfectly normal plumage; the latter is almost mahogany colored. There is an increase of black and rufous, and a reduction or ob-

literation of yellow, buff, gray, and white. The gray of the breast is unchanged except for a number of broad streaks of dark brown, which are confluent in a large black pectoral spot. Although any theory based upon such meagre data must be tentative, yet it is interesting to note that a similar pattern of streaks and spot is characteristic of the first winter plumage. The experiment of Mr. Beebe hints at atavism, or a latent tendency to reacquire pigment in the juvenile pattern. If the melanistic thrush and sparrow were found wild, no systematist would hesitate an instant in designating them as new and well-defined species.

Part V., by far the most important division of the paper, deals with the inca, or scaly doves (Scardafella). After demonstrating the geographical gradation of certain color characteristics in the wing and tail feathers of wild birds, those under experiment are discussed. The summary of the effects of humidity on these birds is given under ten brief paragraphs:

(1.) When typical specimens of Scardafella inca (the pale northern desert form) are confined in a superhumid atmosphere, a radical change in the pigmentation of the plumage takes place with each succeeding annual moult.

(2.) A change, apparently similar in extent and direction, results from an artificially induced monthly renewal of the feathers.

(3.) The change at the first annual moult brings the bird close to the S. inca dialeucos type.

(4.) At the second annual moult, the plumage approximates either the Brazilian type or the typical S. ridgwayi, the succeeding changes being unrepresented by wild species of the genus.

(5.) Intrinsically, the change is at first a segregation and intensification of the melanin, resulting in a clearing up and extension of the white or whitish areas.

(6.) A period of equilibrium later ensues, until the increase of melanin is such that it begins to encroach on the white area; this continuing until all trace of white has disappeared.

(7.) Coincident with this intense blackening of the plumage part of the epidermis, occurs an increase of pigment of the choroid coat of the eye.

(8.) When the concentration of the melanin has reached a certain stage, a change in color occurs, from dull dark brown or black to a brilliant iridescent bronze or green.

(9.) This iridescence reaches its highest development on the wing-coverts, and inner secondaries, where in many genera of tropical and subtropical doves, iridescence most often occurs.

(10.) All these changes take place by continuous variations, and there is no change of color without moult.

The significance of these changes in regard to the direction of evolution, and their correlation with natural selection, taxonomy, and organic selection, are then discussed. These interesting discoveries certainly furnish a significant clue for the bridging of a great gap in our scientific knowledge. The fact that such radical changes in appearance can be brought about—not only by the well-known method of careful selection through many generations, and with definite exclusion of the very improbable theory of change of color in the plumage without moult—but by comparatively rapid, cumulative, apparently orthogenetic, acquired variations, may force a revision of our ideas as to the length of time necessary for the formation of new races and species, when these are based on color characters alone; and this without the aid of De Vries's theory of mutation by one profound saltation.

Dr. Ephraim Cutter, widely known as a voluminous writer on medical subjects, and his son Dr. J. A. Cutter in "Food: Its Relation to Health and Disease" (New York: Gazette Publishing Co.), present some pertinent facts about foods and a large amount of opinion, much of it rather too subjective for general use. To the insistent publisher is attributed the curtailment of the book (384 pages) as well as the banishment of numerous illustrations to the obscurity of a safety vault until they are wanted. What remains embodies rather peculiar views on many matters, among others as to nitrogen (which cannot be "a forceless, negative thing, as conventionally taught, so long as dynamite and over five hundred other explosives, as listed in the 'Standard Dictionary,' depend on nitrogen in themselves or in the air for their explosive properties"), and the "animalization" of fungi in relation to disease. Under foods are included mental or spiritual foods with the explanation that "mental kingdom foods are music, speech, ideas, knowledge, arithmetic, grammar, literature," a comprehensive group. Under each food will be found a few statements concerning its composition and preparation and a discussion of its goodness or badness, its sustaining power, its relation to the "æsthetic" test, the influence of fashion, and yet other relations. Thus we learn, concerning salt, for example:

Salt is an æsthetic in that it gives pleasure and satisfaction to eaters; the shell heaps of the whole Atlantic Coast of the United States evidence the gusto with which the aborigines ate soft shell clams; one cannot conceive of a clambake being unbeautiful (unæsthetic). Why is the clam called festive? Why did the 1900 national convention of undertakers have a clambake in the cemetery at Sharon, Mass., if not pleasurable, for of all men undertakers are most careful of their ethics, and what would clams be without the salt?

Sheep and lamb have spiritual value making for "meekness, submission, innocence, mildness, and patience," but the bean, the ordinary baked bean—low be it spoken—is bad, being "a homely domestic unæsthetic dish to set before one's guestless family" and otherwise dangerous, for "had New Englanders ate the right kind of properly cooked baked beans, perhaps there would not have been so many theological antagonisms in that favored land."

Some four years ago A. Forel wrote a book on the hygiene of the nervous system. Two years later a second edition appeared, and this has now been translated for the Science Series by H. A. Aikins, with the titles "Nervous and Mental Hygiene: Hygiene of Nerves and Mind in Health and Disease" (G. P. Putnam's Sons). The work is a clear and sensible treatment of the questions involved, and deserves to be widely read. In the first part there is an entertaining outline of the author's view of mental phenomena, and of the relation of mind to brain, a singularly brief but neat and clean cut account of the anatomy and physiology of the nervous system, and an illuminating consideration of development and of the significance of the Darwinian doctrines and the mnemetic engraphy of Semon. Forel takes the monistic point of view with a frankness which seems to cause the translator some anxiety. The second part treats of the pathology of the nervous life, the essentials being presented in a masterly manner. In discussing the etiology Forel lays, of course, much stress on the influence of alcohol. This was to be expected from his well-known attitude and his courageous insistence on his convictions. The question might be raised, however, whether he has not here and there put the horse behind the cart. Nervous hygiene in the most general sense is treated in the last third of the book, and a vastly instructive treatment it is, too. Exercise and rational living, work rather than drugs, are the important agencies in warding off disturbances of the nervous action, and here "public, or rather social, hygiene should everywhere be superior to individual hygiene when there is a conflict between them," as there often is. There is also much suggestive discussion of many problems: school, family, the Sunday question, worry, the meaning of "natural," and yet others. The translation is exceptionally smooth and fluent; in fact many paragraphs have a rather remarkable quality of fresh and crisp rendering. *Hemo supersapiens* is almost the only slip in the proofreading that attracts attention.

Prof. Asaph Hall, the astronomer, connected for many years with the naval service, died on November 23. He was born in 1829, and after an interrupted and irregular course of study he went to Cambridge in 1857 to work in the Harvard Observatory. In 1862 he entered the Washington Naval Observatory, where he remained till his retirement in 1891. During these years he headed many government astronomical expeditions and made numerous discoveries, notably in 1877, when he observed the two moons of Mars, which he named Deimos and Phobos. In 1895 he returned to Harvard as a professor of astronomy. Professor Hall was a member of the National Academy of Sciences, a foreign member of the Royal Astronomical Society of Great Britain, and held membership and offices in other learned societies.

Drama.

The Ibsen Secret. By Jeannette Lee. New York: G. P. Putnam's Sons. $1.25 net.

This little book is chiefly remarkable for its ingenuity in the exposition of a futile theory and its radical misconception of what constitutes dramatic merit. It might be dismissed with brief mention—for it has nothing new or significant to say in the way of either criticism or interpretation—if it were not so entirely representative of the attitude of a large class of professed Ibsen worshippers, who have more enthusiasm than discrimination. Saner Ibsenites, of course, are content to base their admiration of "the master" upon his extraordinary skill as a playwright, his vigor and insight as a social satirist, his sturdy courage as a champion of the rights of free will, his hatred of all compromise, and his gifts of poetic imagination. More flat nonsense, perhaps, has been uttered on the subject of his symbolism than on any other of his attributes, real or imaginary, and it is by this that Miss Lee has been chiefly inspired, or misled.

Many essayists before her have probed, to their own satisfaction, and proclaimed the meaning of many of his alleged mysteries, and her contention is that each of the social plays is constructed around one central symbol, a knowledge of which is essential to a proper understanding of the work. Thus the Tarantelle is the key to "A Doll's House," the pistol to "Hedda Gabler," Eyolf and his crutch to "Little Eyolf," the climbing of the tower to "The Master Builder," the hospital to "Ghosts," and so forth. Her solutions may be right in every instance—and it is only fair to say that her arguments are ingenious and show familiarity with the subject—but they are of the smallest possible consequence. She is mistaken in supposing that the employment of symbolism is in itself a proof of genius, that it is a fresh device in fiction of any kind, or that the value of drama is necessarily increased by it. A symbolism which is far-fetched, or obscure, or is capable of half a dozen different interpretations, is useless, especially in drama. Ibsen himself always denied that his plays were symbolical, probably because he knew that anybody with the least power of imagination could find symbolism in everything, and was unwilling that his deeper meaning, when he had one, should be weakened or distorted by every amateur commentator. None of them, it may be noted, have thrown much light upon what he left dark. As for Miss Lee's dictum that symbolism is clearer to the spectator in a theatre than to the reader in a library, few persons will accept it. Imagination has no free flight on the stage.

The suggestion that in "When We Dead Awaken," Ibsen made confession of his own mistake and failure in deserting poetry and idealism for prose and realism is more ingenious than convincing. His egoism would have prevented him from suspecting himself of being actuated by that spirit of compromise which he so unsparingly denounced. Moreover, he could scarcely have associated his prose plays, to which he owed nearly all he had of fame or fortune, with the thought of failure. But that his last play is full of retrospective allusion to his own work has been generally admitted.

Our attention has been called to errors in our review, October 17, of Dr. H. H. Furness's Variorum Edition of "Antonie and Cleopatra," viz.: that in his Preface he makes an "outburst against the study of Shakespeare's source," and that his prefaces "are not always to be taken as representing the editor's sober and fixed opinion; for they occasionally contradict that opinion as expressed in the body of the volumes." On a reëxamination of the book we are bound to say that Dr. Furness in this Preface does not exclaim against the study of sources, but does protest against the misleading prepossession sometimes carried from such study into the interpretation of Shakespeare's characters. There is therefore no discrepancy between such a protest and Dr. Furness's own study of sources in the body of the volume. It is hardly necessary to say that we deeply regret having done injustice to Dr. Furness's monumental work.

Whoever wishes a daily reminder of Goethe will find the "Goethe Kalender" for 1908 (an importation of G. E. Stechert & Co.) just the thing. There are eight pictures of Mephistopheles by Theodor Weicher, and twenty or more studies of the Mephistophelian Devil by Hermann, Possadt, Weiser, Lewinsky, Fr. Alexander, and other star-actors. The book is ornamented by E. R. Weisz, Karl Bauer, and Hans N. Busse, and is tastefully printed. The number of German calendars this year exceeds all that of previous seasons.

If symbolism be, as some writers seem to hold, a great virtue, "The Toy-maker of Nuremberg," which was produced in the Garrick Theatre on Monday evening, might lay claim to a place of high distinction as drama. Ostensibly it is as simple a little story as has ever found its way to the footlights; but for those who search for hidden meanings, it is full of suggestion. Briefly, it shows how an old toy-maker is ruined by the substitution of Teddy bears for dolls, as the pets of childhood, and how he is restored to happiness and prosperity by his son, who knew how to take advantage of the popular craze and profit by a fashion which his father despised. The bears, of course, may plausibly be accepted as types of the rapacity and greed which work evil in a community which has outgrown the innocence of toys. But, apart from its moral, or satirical references, this little piece by Austin Strong is notable for its simple pathos and humor, as well as its blend of romance and realism. Although conventional and perfectly transparent in construction, it is strong in human interest, and proves that dramatic situations are not dependent upon abnormal motives. It was well received, on the whole, by a first-night audience, but was less successful than it deserves to be because some of the principal actors, especially W. J. Ferguson, were incapable of giving full and unaffected expression to the simple humor and pathos of vital scenes. They spoiled the effect by an elaboration of artifice which was entirely out of place in a piece depending for its illusions upon complete sincerity. The representation is likely to improve with rehearsals; but, in any case, is well worthy the attention of those desiring thoroughly wholesome and attractive entertainment.

Music.

THE WEEK AT THE OPERA.

The number of popular operas is so limited that one must welcome every effort to relieve the monotony, even when the experiment turns out as disastrously as did the recent production at the Metropolitan Opera House of Cilèa's "Adriana Lecouvreur." Much more successful was the first production here, on Monday, of Massenet's "Thais," at the Manhattan. It cannot be denied that Massenet writes too much, and that his music not infrequently is theatrical rather than dramatic; yet his operas are vastly more interesting than most of Puccini's or those of the other contemporary Italians; and Mr. Hammerstein must be commended for giving prominence to the modern French repertory as a counterweight to the Metropolitan's Italianism. "Thais" is not a new opera; it was first sung in 1894 in Paris, where the title rôle was created by Sibyl Sanderson. Another American, Mary Garden, renewed its life, and for her sake, primarily, it has been produced in this city. It is based on one of the novels of Anatole France, and is concerned with the adventures of Athanael, an early Christian monk, who goes to Alexandria to rescue the soul of Thais, the beautiful and profligate actress. He succeeds, and she dies a saint, but not until her charms have wiped all traces of saintliness from his soul. It is an effective story for operatic purposes, and Massenet has made good use of it. If he fails to rise to a great dramatic climax his music, on the other hand, is never dull; there is always something in the melody, harmony, or orchestral coloring to keep the attention. None of the music is deliberately Egyptian, like some of the melodies in "Aïda"; but there is quaint Oriental coloring in some of the scenes. The influence of "Parsifal" on the musical portraiture of Athanael is frequently apparent. M. Renaud's impersonation of this rôle was fascinatingly realistic. Miss Garden relies largely on her personal charms—as, indeed, in this opera, she must to make the monk's apostasy plausible. Her voice is serviceable, without being remarkable for beauty or cultivation. As an actress she revealed talent of a high order.

It is not often that a bass singer becomes as popular as a tenor. Even Edouard de Reszke, consummate artist though he was, never quite achieved the same eminence—or the same emoluments—as his brother Jean. Lablache is a conspicuous exception; and may be Theodore Chaliapine, who made his American début at the Metropolitan Opera House last week as Mefistofele in Boito's opera of the same name, will prove another. He is a Russian endowed with one of those huge voices which are a characteristic of that country, and he has made a sensation in every city where he has so far appeared. Yet he is said to have learned only four rôles, his specialty being operatic devils—the hero of Rubinstein's "The Demon," and the Mephistopheles in several of the Faust operas. Judging by the attitude of the Metropolitan audience, all of these operas will get a new lease of life through his diabolical impersonation. That impersonation, in Boito's opera, lacks the subtlety, the sarcasm, the humor to which other artists have accustomed us, but theatrically it is extremely picturesque and effective. Chaliapine won a genuine success despite the annoying claque which applauded him at the wrong places, and the weakness of Boito's opera, the prologue of which has more inspiration in it than all the rest of the score. Miss Geraldine Farrar lent the charm of her art to the rôle of Margherita, and the occasion was further made notable by the début of Ricardo Martin, a Kentuckian, who proved to be a genuine high-class operatic tenor. In the early scenes he seemed to be merely an unusually good lyric singer, but in the prison scene he thrilled the audience with splendid outbursts of dramatic passion.

One often hears the expression "Bayreuth in New York" when a Wagner opera is particularly well done here, but as a matter of fact, neither Bayreuth nor Munich is likely to offer so strong a cast as that which sang "Die Meistersinger" on Saturday night

at the Metropolitan Opera House. The list included Knote, Van Rooy, Goritz, and Reiss, beside Gadsky as Eva; nor have those German cities a conductor who can bring out better the poetry and the eloquence of Wagner's scores than we have in Hertz, whose only fault is that he sometimes overlooks Wagner's injunction to conductors not to forget that there are only a few singers pitted against a whole band of players. It is reported that Weingartner, on assuming his new functions as intendant of the Imperial Opera in Vienna the other day, intimated that he intended, among other things, to emphasize the comedy side of Wagner's opera. In view of that, it would not be safe at this moment to expatiate on the extremely funny Beckmesser of Goritz (who kept the audience laughing loudly) for fear that Weingartner might bribe him to leave us. He is the best Beckmesser we have ever had.

No pianist but Paderewski would have dared to do what he did at his second Carnegie Hall concert, when he devoted half of his programme to two sonatas, one of them his own Opus 21, new to the public, the other the great B minor sonata of Liszt, seldom played, and difficult of comprehension. But the Polish pianist is fortunately so popular that he can afford to suit himself, knowing that the public will fill the hall, no matter how he fills the bill. His sonata proved to be a work of a depth which few can have fathomed at a first hearing, even with the advantage of the composer's own lucid and passionate interpretation. In this sonata there is much musical thought and much musical beauty, especially in the placid andante which separates the surging opening allegro from the rapid and dazing final movement. After the two sonatas Paderewski played a group of Chopin pieces in which he revealed a masculinity of that composer which contrasted strikingly with the feminine Chopin of Vladimir de Pachmann's recent recital in the same hall.

The twelfth volume of the superb edition of the musical works of Rameau is given over entirely to the opera ballet "Platée." This had a single representation at the Versailles court for the Dauphin's marriage in 1745 and a short run at the Paris Opéra in 1749. It has been reconstituted for orchestra and piano, and, by a just revenge of time, is ready for present-day lyric theatres. The place of Rameau in the history of music is now recognized. This piece has another interest. Coypel's famous painting in the Louvre of the male singer dressed up as a nymph is a portrait of Jélyotte, who took the comic part between Jupiter and jealous Juno. A reproduction of this picture, with contemporary frontispiece of the ballet and caricature of Rameau, are included in the present volume, which the editor has made an historical document.

The original manuscript of one of Beethoven's most important compositions (Opus 120) is offered by the great Leipzig bookseller, Karl W. Hiersemann, for 42,000 marks. It is described as consisting of 42 leaves, each having eight staves on each side, except leaf No. 1, which has sixteen staves on each page. The last three pages are blank.

Art.

On Art and Artists. By Max Nordau; translated by W. F. Harvey. Philadelphia: George W. Jacobs & Co.

Dr. Nordau has apparently changed some of his opinions since he ran amuck through modern art in "Degeneration," but he is the same man as ever. His present work shows all his old self-confidence, his old facility of blundering and his supreme contempt for every one else, expressed in his old wealth of vituperative epithet. "The brazen foreheads of the babblers who have the chief say in the art criticism of the time"; "the consequential, high-stepping, deep-thinking drivel of professional and other chatterers, who, to hide their dearth of thought, turn out new words"; "the babbling empty heads, with their pretentious threshing of phrases": these are a few of his gems of language. And as he mentions no writer in any other terms, we are forced to conclude that these descriptions are intended to cover all writers on art except himself.

His change of opinion is most clearly marked in the case of Puvis de Chavannes. A reader of "Degeneration" rubs his eyes when he finds Max Nordau saying of the last picture of the Saint Géneviève cycle that it is "a masterpiece" and that in seizing "once more on the . . . theme which had occupied him from the days of his youth [he was fifty-two years old when he began it!], he found again some of the power and unction which secures to its predecessors their glorious place in the century's art." It is true that, to save his face, Nordau still denounces Puvis's pale coloring as "morbid" and his allegories as "childish" and "pretentious"; but as Nordau finds Whistler's tendency to black and gray a proof of extreme sensitiveness to color and has nothing but praise for Carrière, who banished color entirely, one cannot take the first of these criticisms very seriously. The second amounts to the expression of a dislike for ideal subjects. The former "degenerate" has become an "academic" painter and a "descendant of Cornelius"! Nordau's explanation of his change of front is that "Puvis de Chavannes is dead, and his influence is dying . . . So it is no longer necessary to attack him. . . . Now his appreciation no longer requires polemical pricks, and we can say"—a part of the truth. One could hardly wish for a frânker confession that "Degeneration" was a piece of polemics, and that its elaborate apparatus was perfected merely to supply missiles to throw at whatever the author happened to dislike.

That apparatus having served its turn, is now abandoned. What would once have been evidences of one knows not what aberration are now, in the essay on Bright and Dark Painting, set down, much more plausibly, to the necessity for an artist "exhibiting where his work will be one of two thousand . . . to be as different as possible from these . . . to make a striking impression among them." Mental disease in the artist has thus been succeeded by commercial shrewdness as a cause of changing tendencies in art.

But Dr. Nordau is capable of even more startling changes of opinion than those already mentioned, for they take place inside the covers of this one volume. On pp. 119 and 120 Renoir's pictures in the Caillebotte collection are treated very cavalierly. With him "Monet's joy in light becomes . . . an affectation . . . His two Young Girls at a piano of the color of cranberry syrup; his nude figure of a woman, on whose skin lights and shadows play so unfortunately that she looks as if beaten black and blue, in places even . . ." [we spare the reader the rest] "seek rather to disconcert than to convince us by their unwonted tones." His Girl Reading "is a simple aberration." And lest we should think that Renoir and the other painters represented in this collection may have better pictures elsewhere, we are expressly told that "every verdict on impressionism based on this room is an adequately grounded verdict, against which the attempted higher appeal to I know not what unknown work must be rejected." Yet on p. 259 is a short essay devoted to Renoir in which we hear of "refreshing, individualized beauty," of "mother-of-pearl flesh," of pictures that are "simply charming"; and the conclusion of it is that "he who has the same feeling as Renoir for roses and children is not only a great painter, but also a good and noble man."

We had marked a number of similar inconsequences, but it is hardly necessary to quote them. It is more interesting to take up another side of Nordau's versatility. He gives, with absolute confidence, an account of the origin of Whistler's butterfly, sneering at those who have not understood it. "They just had no eyes; they could not see." This is his explanation:

> The butterfly is nothing but the first letter of Whistler's name—a big W. A Gothic, ornamental W with the two side lines bellied out and a bar in the middle reminds one strikingly of a soaring butterfly with its cylindrical body between its outstretched wings. The definite association of ideas from similarity of form made Whistler, as he painted the W of his signature, think of a butterfly, and he henceforth formed this picture, that was fuller in expression, disregarding the original letter, which seemed to him balder and more meaningless. The butterfly came to the front more and more as the W went further and further back, and it is possible that at last Whistler himself forgot the point from which he started.

We have, for once, given the passage in full, because it is extremely characteristic. It is founded on precisely nothing. Speaking under correction, and from some knowledge of Whistler's works, we state that Whistler never signed with a simple W; that he never used in his signature a Gothic W or a W in any way resembling a butterfly; that the butterfly first appears on canvases which also bear the name Whistler in full; and that in its first form, the butterfly bears no resemblance whatever to a Gothic W, such resemblance being only to be imagined in its final form. The artist himself drew "the evolution of the butterfly" on a sheet which was in the Memorial Exhibition held by the Copley Club of Boston, and that sheet is the most perfect possible refutation of Nordau's theory.

But this is not the only instance of the doctor's knowing things about Whistler which he himself had "forgotten." "From the severe, painfully upright school of Gleyre," says Nordau, "he went forth a master of drawing, *as of the outline of corporeality of three dimensions seen stereoscopically.*" The definition is convin-

cing. but how soon the master "forgot" his mastery is shown by his celebrated letter to Fantin in which he laments his "fearful want of education," and regrets that he was not a pupil of Ingres that he might have learned to draw. We may note also that Dr. Nordau has a keen nose for indecency, and finds it both where it is and where no one else perceives it—in the decorative fantasies of J. W. Alexander, for instance.

If the book were all like the passages commented upon, one might be pardoned for wishing for the doctor's own vocabulary in characterizing it; but it is not. On the contrary, there are many bits of shrewd criticism and many remarks the soundness of which leads one, temporarily, to think of the author as of a person really equipped with some judgment and knowledge of his subject, until the next incredible caprice upsets the notion and leaves one wondering what Nordau would be at and what is the real basis of his confidently pronounced opinions. He becomes an interesting study and tempts one to the formation of what he himself would call a "psychology of Nordau." What one finds in him is a sort of enraged bourgeois. Behind the rash and impulsive journalist, convinced that his own tastes are infallible measures of artistic worth, is the man of hard common sense, with a perfectly respectable liking for the definite, the bright, the finished, and the recognizable; loathing abstraction only less than vagueness; caring naturally only for that in art which represents what he sees very much as he sees it; but convinced that art has a "social mission," and that it ought to fulfil it. As bourgeois common sense is right nine times out of ten, Nordau would be right much oftener than he is, however incapable of understanding some of the finest things in art, were it not for the disturbing influence of this conviction about a social mission, which has nothing to do with the case. It is because he thinks Millet socialistic that Nordau admires him—a painter whose art he so completely misunderstands that he can say, "In technique, Millet follows the Dutch," and whose grand abstraction of style is the antipodes of what he naturally cares for. It is because he scents a socialistic purpose that he can praise Constantin Meunier for a figure which he calls "a reminiscence of the famous Les Foins of Bastien-Lepage," though in Bastien himself he can see nothing but a "debased realism" "which does not spare us a single finger-nail in mourning." It is because of the social tendency of their works that he can forgive, and even praise, the colorlessness and vagueness of Carrière and the sootiness of Cottet, and can even tolerate the pointillism of Henri Martin now and then, antipathetic though these things are to his natural tastes. When he has work to deal with which has no other purpose than that of appropriate and noble decoration, his natural antipathies are allowed free play; paleness of color, abstraction of form, and elevation of style are equally anathema to him.

But the essay on Gustave Moreau and one or two others, still remain to be accounted for, and it is difficult to account for them on any other ground than that their author wanted to show that he, too, could be "up-to-date" and esoteric. Perhaps it is a waste of time to try to find any principle of consistency in his "wild and whirling words," and best to dismiss the book as a piece of sensationalism, or the expression of personal whim.

The translator is to be congratulated on his success in avoiding foreign idiom and in making his translation read like a piece of original and only too vigorous English.

The Société du Mercure de France issues with a portrait "Écrits et lettres choisies d'Eugène Carrière." His fragmentary writings on art occupy a little more than a third of the three hundred and fifty odd pages. To those who possess Charles Morice's excellent memoir, this volume brings rather little that is new. In particular, the letters are mostly too slight and occasional to justify the space they occupy. Yet those who concern themselves intimately with this remarkable painter and thinker will want this collection of his *pensées*. Here for example is the full text of his fine protest against restoration; the curious transcendental address on Art and Democracy, with its appendix, a scheme for a popular academy of the fine arts, and among the novelties a circumstantial account (p. 322) of Carrière's method of painting. Of pathetic and wider interest are the pencil conversations—his only means of communication in the last months. With one of these more memorable sayings (to Rodin) we must close:

I used to say, What! Always do the same thing? How get away from it? And then I had the revelation that one must remain the same, but grow greater, which is the true manner of attaining variety.

In the French handy series Les Villes d'art célèbres, special mention should be made of the "Versailles" by Pératé, with 149 illustrations. The average traveller's aimless, bewildered wandering to and fro in palaces and grounds discloses little of this richest collection of national splendors existing perhaps since the world began. In general, the thirty volumes of the series so far published are valuable as eye-openers. Some volumes are by authorities in their special field, like the "Florence," by Émile Gebhart of the French Academy, and the "Ravenna" and "Palermo and Syracuse" of Ch. Diehl.

Etchings by Jacquemart and wood engravings by Prunaire are being shown at the Lenox Library; and "auto-chrome" colored photographs, at the rooms of the Photo-Secessionists, No. 291 Fifth Avenue, till December 30. Paintings by C. Austin Needham are on exhibition at the New Gallery, No. 15 West Thirtieth Street, till December 7; early Italian and Spanish paintings at Ehrich's, December 15; paintings of the Dutch and French schools, Julius Oehme's; and paintings of the French school, Durand-Ruel's.

Finance.

THE DURATION OF SUSPENDED CREDIT.

The country has now been fully four weeks in a state of suspended credit—an extraordinarily long period for the virtual stopping of the wheels of finance, throughout the United States. The question is now being asked, with naturally increasing anxiety, How long can such a state of things continue?

It certainly cannot last much longer; and the reason is. not that some breakdown will occur, but that the machinery of relief is actively at work, and in the light of all precedent must soon bring the situation of the banks back to normal. A condition such as now exists has never, even in panics much worse than this, lasted more than a few weeks. The present crisis can scarcely compare for violence with that of 1857. In that year, the New York banks suspended specie payments on October 14; they resumed full payments on December 12, and they did this because they had received sufficient gold from England. In 1873, the New York banks issued loan certificates on September 19; on the same day the Stock Exchange closed, restriction of cash payments at the banks began, and there was a premium on currency. This premium disappeared about October 20, and on November 1, in accordance with a Clearing House resolution of a week before, banks returned to their ordinary way of business. That is to say, in the panic of 1857 suspension of full cash payments at our banks continued for eight weeks; in 1873 between five and six.

Buy and sell bills of exchange and make cable transfers of money on all foreign points; also make collections, and issue Commercial and Travellers' Credits available in all parts of the world.

International Cheques. Certificates of Deposit.

BROWN BROTHERS & CO.

No. 59 Wall Street, New York

Still more instructive, perhaps, are the events of 1893, of which we have a more complete record. In that year, as to-day and in 1873, the currency premium was the key to the condition of the banks. In the nature of things, there can be no premium on currency, that is, no depreciation of checks, when banks are freely paying cash. Therefore, the beginning and the ending of that premium show exactly the period during which partial suspension of cash payments has existed. The premium on currency first appeared, in 1893, a day or two after the Stock Exchange panic of July 26. The first large consignment of foreign gold arrived on August 7; yet after that arrival, the currency premium rose to 4½ per cent., as against a maximum of 2 per cent. the week before. It continued alternately to rise and fall during several successive weeks. This meant that not enough gold had yet come to relieve the banks, or else that what had come had not yet been fully distributed. On September 2, there were practically no orders for currency at brokers' offices, and the few transactions made were at a nominal premium of ¼ and ⅜ per cent. That was the last quotation of a currency premium in 1893. As against the eight weeks' duration of suspension of payments in 1857, and something under six weeks in 1873, a little more than five weeks were required in 1893.

Were this last analogy to be exactly repeated, the currency premium of the panic of 1907, which was first bid and paid on November 2, would vanish at the end of the first week of next month, in response to complete resumption of payments by the banks. As a matter of fact, the predictions of experienced bankers, during the past few days, have fixed December 7 as the probable outside limit.

The Nation.

NEW YORK, THURSDAY, DECEMBER 5, 1907.

The Week.

The most interesting parts of President Roosevelt's annual message relate to the financial crisis and business depression. On this subject his words are few but satisfactory. He again rebukes the foolish hoarders of money; declares that the banks of the country are solvent and its business methods as a rule honest; and pronounces in favor of measures to secure a more elastic currency. The President also has a judicious reference to the extravagance and the spirit of speculation which had so much to do with causing our present troubles. In these respects, his attitude is all that could be desired. Why, however, has he not a word about governmental extravagance? Every prudent man is now cutting down expenses: is no duty of retrenchment laid upon the government? President Roosevelt, however, appeals frequently for "liberal appropriations"; he nowhere urges economy. Indeed, the government estimates sent to Congress, in this time of general embarrassment and falling public revenues, call for $77,000,000 more than for the current fiscal year. Where is that great increase to come from? From taxation, of course, and that means that people who are struggling to meet their obligations are to have an extra financial burden laid upon them by the government. A good example of the way in which President Roosevelt persuades himself that what he wants must be had, no matter what the cost, appears in his recommendation of a great increase in the navy. Last year, he had arrived at what was set forth in his message as a carefully reasoned and settled naval policy. It was simply to make good the annual wastage, through deterioration, by building only one battleship a year. But now we are suddenly informed:

> To build one battleship a year . . . is not enough. In my judgment, we should this year provide for four.

This surprising recantation of the Presidential wisdom of last year unhappily goes with the suspicion that the battleships were to be sent to the Pacific partly in order to extort from Congress the building of more for the Atlantic. Ominous, in this connection, is the complaint made by Congressmen about the proposed laying off of 6,000 men in the various navy yards, and the reply of Secretary Metcalf that, if the official building programme is adopted, there will be work enough for all. For our part, we hope that the increase will be resisted in Congress, both on the ground, which President Roosevelt has before taken, that our present navy is large enough, and on the ground that, just now, the nation, like its citizens, must be economical.

Speaker Cannon's address to the Republican caucus on Saturday night, after his renomination without opposition, should be read by everybody who would have a clue to the probable course of legislation this winter. It was not only a stand-pat and do-nothing speech, but one full of scarcely veiled antagonism to the President. The Speaker declared himself against "experiment in legislation." He is also for "leaving to the people of the States the jurisdiction not granted to the Federal government." Even more outspoken was Mr. Cannon in opposition to the President's pet plan of a Federal inheritance tax. It could have been only that which the Speaker had in mind when he said:

> It is not wise to add to the revenue, and it is not necessary or desirable to transfer burdens from the local and State Treasuries to the Federal Treasury—to foster a centralizing power.

Whether it be true or false, as most of the Washington corrrespondents state, that Congress is already bristling with dislike of the President's large programme of law-making, it is clear that the Speaker of the House is for sitting tight and doing the least possible. His policy could not be called that of "Rest and be thankful"; it is more like "Rest and grumble," but, anyhow, it is "Rest."

One who expects the House of Representatives to be uniformly wise, statesmanlike, and far-sighted is frequently disappointed; but there may be still some comfort in the reflection that with all its faults the House *is* representative. And the House, which has just convened, viewed simply in its representative capacity, is perhaps a little more than ordinarily faithful as a reflection of the multifarious American people. It is thoroughly characteristic of our national habit of changing occupations and attacking brand-new tasks with confidence, that practically one-fourth of the members of this House have never served in Congress before. Only one-tenth of the new men are college graduates, a proportion not very far from that which would obtain among the leading citizens of a typical American town. The body as a whole represents the honest ignorance, the "want-to-know" spirit, of the country considerably better than it does its expertness and its learning. Yet the Representative who is reported as going straight to the Treasury Department to ask frankly what a bank reserve really is, is far from being the most dangerous sort of man to make our laws. As for purely political issues, the House comes much nearer than its predecessor to representing fairly the balance of parties at the time of its election. With 54 per cent. of the votes cast for Congress in 1904, the Republicans carried 64 per cent. of the seats in the "Roosevelt Congress." Last year, with less than 51 per cent. of the votes, they still hold 57 per cent. of the places. That, however, is as near to the facts as the figures are likely to come without some regular system of minority representation.

The plight of the Representative from the Thirty-fourth New York District, who could not go into the Republican Congressional caucus, and would not go into the Democratic, is a reminder of the price which under our system must be paid for any large share of political independence. We do not know who is to find fault with the logic of Col. Hepburn, the implacable chairman of the caucus. Peter A. Porter made a successful campaign against James W. Wadsworth, the regularly nominated Republican candidate for Congress. In the face of that fact, Mr. Porter's protestations of life-long Republicanism and a Presidential endorsement are unavailing. Those who do not support Republican candidates are Democrats, or no better than Democrats. If Mr. Porter had spent, not one life, but six reincarnations, in the Republican fold, and had been endorsed by twenty Presidents, his case would be no better. Just the same logic was applied last year by a Democratic Senator. "A member's right to act according to the dictates of his conscience is absolute," said Mr. Bailey, in effect, "but the caucus exists for party members in good standing." There have been free-lances in Congress before, and doubtless will be again, but the free-lance in the vast majority of cases ends by either withdrawing from public life or gravitating to the opposition party, unless, as sometimes happens, he comes home as a prodigal. A public man is indulged to-day in exhibitions of independence that would have been fatal to him when the school of political thought for which Col. Hepburn speaks was everywhere in control. But the whole theory of party government is inconsistent with the idea that a man may compass the defeat of his party ticket one year, and the next be welcomed with open arms to its inner councils.

The speeches before the Philadelphia Academy of Political and Social Science on Monday night were noteworthy be-

cause several eminent financiers advocated the plan of a central bank. In October of last year the New York Chamber of Commerce adopted the report of a special committee suggesting such a bank of issue, on the lines of the state banks of Germany and France, as an alternative to such a revision of the present banking law as would provide asset currency. But the committee's report conceded the political obstacles in the way of the expedient, and John Claflin virtually dismissed the project as impracticable. Nevertheless, at the discussion in Philadelphia, the plan of a central bank was revived by William A. Nash of the New York Corn Exchange Bank and the Clearing House Committee, by Jacob H. Schiff and Isaac N. Seligman. Mr. Schiff was still inclined to the opinion that the country is not yet prepared to sanction a central institution with its wide powers. Mr. Nash, on the other hand, referred to this assumed public dislike as "a venerable and senseless prejudice which obstructs the national well-being," and declared that "we must kill this bugaboo and exorcise this ghost." Mr. Seligman, basing his argument on the great relief which such a bank would have been able to offer in the recent panic, was wholly in favor of it. No doubt, among the diverse schemes for banking and currency reform, this plan will get a more favorable hearing than it received a year ago—partly because the argument as to the service it would have done is sound, and partly because the distrust of a central bank can hardly be what it was in 1906. To talk of a huge new banking institution, backed by the public credit, was mere waste of words when people had before their eyes one of the most reckless exploits in abuse of credit by bankers and banking institutions already in the field. But the "boomers," "promoters," "syndicates," and "multi-millionaires," who built up that ill-fated Wall Street speculation of 1906, are not likely, for some years to come, to repeat the experiment. Whether this chastened spirit on the part of speculating capitalists is enough to remove all suspicion for the future, is another question. From a practical point of view, we suspect that the most formidable opposition to the scheme would come from the banks already doing business in this country—especially from the small institutions, whose influence on opinion, through personal intercourse with customers, is very great. They would certainly be up in arms against a central bank with branches, and they might not look kindly on the surrender of a few of their own present privileges into the hands of one great institution, even if the central bank were not to invade their territory.

The Charleston *News and Courier* has made the interesting discovery that, for the first time in many months, there is a surplus of freight cars for the handling of the business of the Southern Railway in its city:

> It appears, after all, therefore, that the Roosevelt panic has not been confined to the gamblers of Wall Street, so intimate are the relations between the actual business operations of the country and the speculation of Wall Street. It is not a healthy condition.

Things move slowly in the South, but the truth will penetrate. By and by a further understanding of what has happened and is happening may be looked for. The West, too, has awakened to the hard fact. At first all Westerners declared that the panic would affect them not at all. Now they are realizing that New York is still the financial heart of the country, and that anything that disturbs its functions is certain to be felt in the extremities. That Wall Street speculation and dishonest or "wild-cat" banking have had considerable to do with the panic, we have steadily pointed out. But rural editors may shortly be expected to recollect that the gamblers are comparatively few, and that honest bankers are with us in large numbers and honor the whole country, whose banking they so largely do. When all of these are affected, it is ridiculous to prate only of the gamblers. As for the slackening of trade in Charleston and elsewhere, the reasons for that are numerous. We would gladly dispense with all our Stock Exchange plungers, but there were economic and financial laws before they appeared, and will be even after the gamblers have been taken in hand.

Senator Foraker's announcement that he is a Presidential candidate will be everywhere accepted in just one way. It is not that he can expect to win, but that he hopes to make some one else fail. His declaration is really one of war upon the President, and upon the President's candidate Viewed in any light, it must be taken as one blow more to the candidacy of Secretary Taft. It means a hard fight, from now on, in every district of Ohio, for the control of delegates to the National Convention. But unless political traditions are to be made over, the forcing of such a contest upon the "favorite son" of Ohio renders it certain that the wheels of his chariot will drive heavily in all other States. If even his own State is not heartily and unitedly behind him, how can Secretary Taft hope to arouse enthusiasm elsewhere? He has the President's endorsement, to be sure, but a good deal of political paper, even so endorsed, we see going to protest in these times. Senator Foraker rings the changes upon Mr. Roosevelt's alleged determination to "eliminate" him from public life. It is clear, however, that it is the Senator's main object at present to eliminate the Taft Presidential boom. It looks very much as if he would succeed.

President Joseph Swain of Swarthmore has submitted to twenty-six other college presidents the problem raised by the Jeanes bequest—money offered on condition of abolishing intercollegiate athletics. His statement of the problem was ingenious. Have the trustees of a college the right to bind their successors to such a restriction in perpetuity, he asks, and then, concretely, have they the right to do so if the inducement is (1) a million dollars or (2) fifty thousand dollars? The question would therefore seem to involve a delicate point of "cashuistry." In defence of Swarthmore's practical rejection of the gift we must grant that too many American colleges suffer to-day from charter restrictions, because of which they have received large gifts. Brown, for instance, until the Rhode Island Legislature abrogates a provision of its charter, must always choose a Baptist for president; Trinity is, we believe, tied to the Episcopal Church, and Wesleyan to the Methodist. These limitations were in accord with the spirit of times sixty or seventy years ago, but are now outgrown. Yet, if the Jeanes bequest had carried with it the condition of perpetual participation in intercollegiate athletics, we wonder how many college presidents would have seen so clearly a dangerous precedent, or a wrong to future faculties and trustees.

In the Canadian Parliament, which reassembled at Ottawa last week, the Japanese immigrant question should furnish one of the most interesting topics of discussion. We say discussion rather than debate, because it is not very probable that the Conservative opposition will espouse the cause of Asiatic immigration with exceptional zeal. The Ministerial statement declares that "the unexpected influx of immigrants from Oriental countries into British Columbia aroused a strong feeling of opposition." With the growing influence of the Canadian West, the sentiment of that section of the Dominion must naturally be more strongly reflected in the policy of both political parties; and it is apparent that the feeling of the Canadian West, whether due to real pressure exercised by Asiatic competition, or to the influence of labor agitators, is hostile to Oriental immigration. If the Conservatives, therefore, expect to recruit their strength from the West, in the not far distant general election, they are not likely to show themselves strongly pro-Japanese.

The recent automobile show in Lon-

don has been hailed by all sections of the British press as proof that the English motor-car industry has overtaken its Continental competitors. The *Mail* insists that the English product "compares most favorably with the best product of the French and German workshops," and it adds that the prices are lower. Naturally, the *Spectator* pounces upon this statement with glee, because the *Mail*, in advocating Mr. Chamberlain's plans for protection, had been citing the motor-car industry as proof that England needed tariff barriers. "In reality," says the *Spectator*, "the rise of the motor industry gives the strongest proof of how entirely unnecessary it is to foster an industry by protection, or, rather, we should say, how free trade is by far the best foster-mother." If there ever appeared to be reasons for protection, it was in this industry, and Sir Gilbert Parker and other leaders quickly seized upon it. The nearness of the French and German manufacturers, the lower wages they paid, their earlier start, their indisputable aptitude for mechanics—all these things made it plain, according to the Chamberlainites, that there was no future for the English automobile makers. But in actual fact, the severity of the foreign competition compelled the English manufacturers to produce as good an article more cheaply than their rivals. The protectionists must now look for another argument.

The automobile, unlike Ibsen's Master Builder, refuses to be intimidated by the knocking of youth, in the form of the airship, at its door. Plans are being made for a motor car race from New York to Paris by way of Bering Strait, a project which has its inception in the recently concluded race from Peking to Paris. At the present moment, one adventurous traveller is engaged in crossing Central Africa from the Indian Ocean to the Atlantic in an automobile, and an Antarctic expedition has equipped itself with power machines for crossing the vast ice-fields of the south polar regions. What effect such arduous experiments will exercise on the evolution of the automobile, is difficult to forecast. Radical departures in construction are, of course, necessitated by the special use for which the machine is designed. Steel-spiked tires for Siberia and the polar regions, and enormously flat tires for work in the African jungle and marshland, are important departures from the original type. How far may such variations continue without destroying the identity of the type? And to what extent may an automobile be hauled by Mongolian camels or carried across African rivers piecemeal on the heads of negro bearers, and still enable its owner to boast of having made a spectacular "automobile" trip?

At the age of eighty-seven, Florence Nightingale has been made a member of the Order of Merit, instituted in 1902 by Edward VII., as a reward for conspicuous public service. Miss Nightingale should be at home in the distinguished company to which she has been admitted. Lord Roberts, Lord Kitchener, Marquis Oyama, Admiral Togo, and Lord Lister are in a position to discourse with interest and authority on the subject of the infliction and cure of gunshot wounds, though possibly the Angel of the Crimea may find herself a little behind the times on either phase of the art of war. She cannot expect to enjoy her new dignity for many years to come, if "enjoy" is the proper word at all to use of a woman who at the age of thirty-six refused to receive the public honors offered her by the British people, and, her work done, fled surreptitiously to her quiet country home. To the world at large the appearance of her name in the newspapers must have been a surprise; most people had forgotten that she who is already enrolled among the immortals is still with us.

Any one accustomed to the arrogant tone heretofore assumed by German military officials in discussing army affairs with mere civilians can only marvel at the speech of the Minister of War, Van Einem, last Friday. He was not merely defending the entire military caste, but was actually replying to the attacks of Bebel, the one Socialist above all others whom the army likes to stigmatize as an enemy to his country. Instead of the usual defiance and abuse, Von Einem was on the defensive throughout. The worst of the immorality brought out in the Von Moltke-Harden suit he denied, but, if the cable dispatches are to be trusted, he admitted that most of Bebel's allegations were correct, and that the army is in many places gravely tainted. No one could have believed such a confession possible a few months ago, and it can be explained only on the ground that the public indignation and unrest over the recent revelations necessitated a clean breast of it. As it is, the army is humiliated as never before, and those who have been whispering that the Prussian troops are not what they used to be will have fresh grounds for their belief. It is a great opportunity for the Kaiser to do vigorous house-cleaning, to put a stop to the gambling, hard drinking, and profligacy which lead inevitably to worse practices. So far, however, he has never availed himself of a similar opportunity. Moreover, he would be the last to admit that the fearless opposition and criticism of Bebel make him a person of great value to the whole nation.

The latest news from Portugal is that the danger of revolution has been greatly exaggerated. The opponents of the absolutist régime inaugurated by Premier Franco last May comprise all the political parties, Conservative, Liberal, and Republican. But it is only the latter that really possesses sufficient influence with the popular elements to make an uprising possible. The two other parties are shown to have pursued a policy of such consistent selfishness and disregard of popular needs that their ability to stir up the masses against the throne must be seriously questioned. King Carlos's cause possesses a powerful support also in the country's international relations. Great Britain, as the historical friend of Portugal, is probably unwilling to countenance a revolution which might let loose Spanish ambitions in the Iberian peninsula, and lead to the disruption of the Mediterranean *entente* which British diplomacy has labored so sedulously to establish in the course of the last few years. More disturbing still would be the effect which an upheaval in Portugal would produce on the colonial ventures in Africa. Portuguese West and East Africa would then become prizes to set German and British Imperialist hearts a-beating. Even as it is, British eyes in South Africa have been turning longingly to Delagoa Bay and its harbor, so conveniently near to Johannesburg.

In the Russian Parliament the unexpected came again with last week's great debate on the reply to the address from the throne, when the Duma, by a vote of 246 against 112, declared that the title of Autocrat "is no longer tenable within the Russian state, and is incompatible with the régime inaugurated by the manifesto issued by Emperor Nicholas on October 30, 1905." We need not exaggerate the importance of such action on the part of the majority in the Duma in order to hold that the declaration is, nevertheless, largely significant of what parliamentary influence in Russia in the near future must be, if it is to be at all. It must be moderate, opportunistic, ready to bear injuries and insults in the hope of what the time to come may bring. That the Duma could become a mere reactionary tail to the autocratic kite, we have never believed, in spite of the swelling arrogance of the monarchist and ecclesiastical members, and of the difficulty of forming a working *bloc* of the Centre. A Duma that will go back is impossible, because experience has shown that it is impossible for a number of intelligent men, no matter of what ultimate political creed, to come together without recognizing the absolute, pressing necessity of change. The so-called Landlords' Duma may yet develop unsuspected reserves of Liberal thought.

"INJUNCTION-PROOF" LAWS.

Last week the Governor of Alabama signed twenty-one bills for fixing railway rates in that State, bills which had been hastily passed by the Legislature in extraordinary session. They were enacted indiscriminately, and almost without discussion. Indeed, in his message to the Legislature, Gov. Comer declared that the only issue was whether the State or the railways should be supreme. Accordingly, all these laws were made what was boastfully called "injunction-proof." That is, it was provided that the penalties for violation should be enforced from the day that the railroads took any of them into court to test their legality. Thus it was exultingly said that the companies would bankrupt themselves by the very fact of attempting to secure their rights in court. In the case, for example, of the passenger fares prescribed by statute, penalties amounting to $2,000,000,000 might be enforceable against a railroad assessed for taxation in Alabama at about $30,000,000. But almost before the ink of the Governor's signature of these bills was dry, the State officials were enjoined by Judge Jones of the Federal Circuit Court from enforcing any of them. It was the injunction-proof laws that did not "go."

They could not, so long as the Constitution of the United States exists, and the decisions of the Supreme Court are executed. The very situation contemplated by these Alabama laws has been passed upon by the Supreme Court. In the Kansas City Stock Yards case, Mr. Justice Brewer reading the opinion asked:

> Do the laws secure to an individual an equal protection when he is allowed to come into court and make his claim or defence, subject to the conditions that upon a failure to make good that claim or defence, the penalty for such a failure either appropriates all his property, or subjects him to extravagant and unreasonable loss?

After citing various illustrations, the court held:

> It is doubtless true that the State may impose penalties such as will tend to compel obedience to its mandates by all, individuals or corporations, and if extreme and cumulative penalties are imposed only after there has been a final determination of the validity of the statute, the question would be very different from that here presented. But, when the Legislature in an effort to prevent any inquiry of the validity of a particular statute, so burdens any challenge thereof in the courts, that the party affected is necessarily constrained to submit rather than take the chances of the penalties imposed, then it becomes a serious question whether the party is not deprived of the equal protection of the laws.

Plainer notice could scarcely have been served that such an attempt as this one by Alabama to shut off access to the courts, would itself be enjoined by the Federal courts. It is not a question of State rights. The States themselves, by adopting the Fourteenth Amendment, waived all pretence to such alleged rights. The whole matter comes down to the fundamental right of citizens of this country to be protected in their property, and to be afforded "the equal protection of the laws." As it was put by an Alabama State Senator, in a speech at Montgomery on November 12, the theory upon which Gov. Comer was proceeding, in denying effective judicial inquiry, was that in case of conflict between an act of the Legislature and the Constitution of the United States, it was the former that was to be held sacred, while the latter was to fail. This preposterous doctrine was happily knocked in the head by another Alabamian—former Confederate, ultra State-rights man, and himself once Governor of the State—Judge Jones of the Fifth Circuit Court. He promptly clapped an injunction upon the injunction-proof laws.

In all the outcry against "government by injunction," no man who knows anything about the law, or whose opinion is otherwise worth considering, has ever denied that the use of the injunction to prevent what may be irreparable injury, is sometimes absolutely necessary. This is a principle embodied in the jurisprudence of the States, as well as in our national laws. The Alabama Supreme Court, it has been pertinently pointed out, has repeatedly enjoined the enforcement of statutes or municipal ordinances pending the determination of their constitutionality. In one leading case, Brown vs. Mayor of Birmingham, it held that "prosecutions under an ordinance which would destroy or impair property rights to the irreparable injury of the owner, may be enjoined, pending the determination of its legality." The usual rule is to maintain the *status quo* while awaiting final adjudication. But these Alabama railroad laws undertook to collect penalties from the very moment of appeal to the courts. To prevent such an act of tyranny, it was inevitable that a Federal court would intervene. The laws are not set aside; their operation is merely enjoined until it can be decided whether they were beyond the competence of the Legislature.

The ordinary presumption is, of course, that the Legislature proceeds with full knowledge of the facts. Hence, as the Supreme Court itself said in a case against the Railroad Commissioners of South Dakota, an inquiry by a court "whether the rates prescribed by a State Legislature for the carriage of passengers and freight are reasonable" is both "difficult" and "perplexing." Yet this fact, it added, "affords no excuse for a failure to examine and solve the questions involved.' The Legislature itself should first have made the due examination. That the Legislature of New York did not, before passing the two-cent fare bill, was Gov. Hughes's main reason for vetoing that measure. But Gov. Comer of Alabama urged *his* Legislature to act, as it did, without investigation. The bills were passed in bundles. That fact alone would lay them open to suspicion, and make them a fair subject of judicial inquiry; but to prevent the latter by an odious and crushing levy of penalties was the whole plan of this legislation. That it will be broken and disallowed by the Federal courts is as certain as anything in law can be. This part of the Alabama bills must be held to be unconstitutional, even if it be finally decided that the rates and regulations governing the Alabama railroads are reasonable and should be upheld. No court can hold that an appeal to the courts can be lawfully penalized.

It was not only, be it remembered, the protection of the Federal courts that this Alabama legislation set out to nullify; even that of the State courts was denied to the railroads. As State Senator Bowie clearly stated at the Montgomery mass-meeting:

> The purpose to deny these people the equal protection of the laws is written in every bill when it says that the penalties can be collected and enforced, notwithstanding their orderly suspension by a court of justice having jurisdiction, even though that court be a State court. That is in there—it is in them all.

There could be no clearer case for invoking Federal jurisdiction. The Alabama legislators must have known that they were rushing upon an injunction. They had but to read the Fourteenth Amendment and the laws passed by Congress in pursuance thereof, with the decisions of the Supreme Court interpreting the same, to be certain that what has happened was bound to happen. Yet, we admit, they might have alleged one hope. Having successfully set aside that part of the Fourteenth Amendment which forbids any State to "abridge the privileges or immunities of citizens of the United States," they might argue that they could be equally fortunate with the part forbidding any State to "deprive any person of property." But they have found that property is more sacred than the suffrage.

THE TREASURY NOTES.

The abrupt cutting short of the issue of one-year government notes, at a moment when probably not $15,000,000 out of the announced $100,000,000 had been allotted, we take to be the Treasury's admission of the fact, to which the *Nation* called attention when the plan was published, that the troubles of the banks were being rapidly removed through natural processes of relief before the government intervened. Hence the expedient of 3 per cent. notes, quite apart from the objections to the plan itself, was never needed. Each successive day since the unfortunate Treasury bulletin

of November 18 has added evidence of what was well known in experienced banking circles before that date—that the panic had reached its climax and was on the wane, and that distribution into bank reserves of the gold engaged for America before the middle of the month would of itself in a couple of weeks bring the banks to a normal status.

In maintaining this belief we relied on the lesson of similar crises in the past. By this test, and by this alone, can the nature and probable outcome of a period such as that through which we have just passed be judged. The severest criticism which must be passed on Secretary Cortelyou is that he acted in this grave matter without obtaining the counsel of bankers most closely in touch with real conditions, and apparently without knowledge of the history that foreshadowed the course which events have subsequently taken.

The government has thus abruptly suspended the sale of its 3 per cent. notes, not at all, as we understand it, because of a failure of subscriptions. Deeply as the conservative financial community distrusted this engine of indirect inflation, the inducement for banks to invest was inviting. We deem it fortunate that the grave risk incurred by throwing $150,000,000 new securities on a panic-stricken market, should have been escaped. How largely the financial distrust which culminated in the October crisis, was a result of the failure of New York city's two bond offers, it would be difficult to say, but those incidents contributed to the general uneasiness. What the narrow escape from failure by the two national loans in 1894 involved, most of us remember; and it is not the smallest item in the blame which the Treasury must incur, that it exposed the public credit to at least the chance of a shock which refusal to take the loan must have invited.

But if offers for the new notes were not lacking as a whole, the kind of bids on which the Treasury had apparently reckoned with most confidence were entirely absent. One great purpose of the issue of government securities was professedly to "draw out" the cash of money-hoarders, who were presumed to be so distrustful of credit that they would put back the money neither into bank deposits nor into ordinary investments. But in this conception of the money-hoarder, Mr. Cortelyou seems to us to have missed the truth entirely. The speculative hoarder keeps his cash in hand with a view to the premium on currency; other hoarders merely wait to see if the banks are to maintain solvency or not. That neither class was looking for something new and safe in which to invest is proved by the result of the note-issue; but that result adds little or nothing to the knowledge, derived from previous occurrences of the sort, of the fundamental tendencies in a hoarding mania.

Mr. Cortelyou deserves credit for facing the facts and undoing as far as he could the unlucky note experiment. He also deserves praise for his firm stand against one extremely vicious project which he was besought to incorporate in the plan; that is, to authorize tacitly the clearly illegal use of these 3 per cent. notes as bank reserves. To this he gave absolute refusal. But the best that can be said of the whole affair is that the Treasury has learned a lesson by experience.

The news of this result will be read with considerable humiliation in certain quarters across the ocean. No financial episode in our time has been so amazing as the sudden clamor, in foreign financial circles esteemed as centres of conservatism, for radical and revolutionary action by our government. This extraordinary state of mind—which has led astray some of the highest banking dignitaries of the Old World—can be explained only on the ground that financial London itself was in a mental panic, and spoke, if it did not act, as panic-stricken people do. The London *Economist*, organ of financial conservatism, opened its discussion of our money crisis by remarking:

> Before a complete failure of the public confidence, no credit system and no currency in the world could hope to stand. But for the moment it is clear that the currency is the crux of the situation, and that some means must be devised to remove the existing premium, to enable banks once again to cash checks freely, and to induce business men throughout the States to bring their money back into the ordinary channels of banking.

Nothing could be more sound. And how is this wholesome rule applied? By examining thoroughly the nearest precedent of a money-hoarding American panic, that of 1893, in which, without exception, every incident of the present affair was accurately foreshadowed, and in which the crisis was surmounted by the automatic processes of the markets? Not at all. The *Economist* declared with emphasis that there was no way out of our dilemma save through issue of government fiat money. One can imagine Walter Bagehot turning in his grave.

OUR POLITICAL DISPUTANTS.

Mr. Bryan never showed more clearly the clerical bent of his mind than in his speech—sermon, we had almost said—at Washington last week. His "heads of discourse" would have delighted a professor of homiletics. There were the four things that Roosevelt had stolen from the Democrats; the four things that he dared not steal; the four things that were all his own and that were fearfully un-Democratic. The whole was a beautifully balanced sermonic plan. It all recalls what Leslie Stephen said about Blair—that his sermons were merely "essays composed by a professor of rhetoric to illustrate the principles of his art." And Bryan's use of Democracy, in the purely abstract sense, is wonderfully like Blair's employment of Devotion, as given by Stephen:

> To thee, oh Devotion, we owe the highest improvement of our nature, and the merit of the enjoyment of our life. Thou art the support of our virtue and the rest of our souls in this turbulent world. Thou composest the thoughts, thou calmest the passions; and, in short, givest me an excellent opportunity for finishing a paragraph with an admirable prosopopœia, according to approved rules of art.

Of all this attempt to trace current political doctrines to their party origin, and to decide who stole whose clothes, we think the country is heartily sick. People have left off caring about the whence, and are giving their attention to the what. It makes little difference what was the origin of a policy if its effects are pestiferous. And there is really no end to this kind of recrimination when once you embark upon it. While Bryan and Roosevelt are disputing as to who was the only begetter of plans which they alike favor, Tom Watson rudely bursts in to accuse them both of having got their ideas from the Populists. And we must say that he has an unpleasant amount of circumstantial and documentary evidence to prove his case. If one turns back to the platform of the "People's Party" of 1892, he will find embedded in it several Roosevelt doctrines, including the graduated income tax, and the distinctive Bryan doctrine of government ownership of the railways. But the whole inquiry is barren and wearisome. The country is to-day less interested in origins than tendencies. And it emphatically does not hanker after a party or a candidate that can only echo the political wisdom of Bre'r Mud Turkle (we think it was he), who said: "I know where I come from, but I don't know where I'm gwine."

Let it be admitted that no party has a monopoly of ideas, any more than of virtue. It is doubtless true that political managers take their own wherever they find it; and that in the vast ferment of opinion in a democracy like ours, notions find their way into all parties at once, no man can say exactly how. But all this, in a situation such as we have upon us to-day, is of no practical benefit. It leaves you, as the Scotchman said of claret, very much as you were before. Some way of getting on is what we ask political leaders to suggest; and if all they have to offer is personal and party recrimination, the general verdict will be very apt to be, A plague o' both your houses.

Some things are clear in the flux of political convictions and the break-up of parties. One of them stands out of the

very conditions under observation. Party labels signify less than ever. There is no rallying power or inspiration in the name Republican or Democrat, merely as such. The parties have exchanged rapiers too often, like Hamlet and Laertes, to leave the people wholly certain of the identity of each, or with what weapons it will fight. It is not the title, but the programme, of parties that will really count next year. And, of course, a vital part of their programme is the men they put forward to carry it into execution.

Now, at this point, both parties have to face a fact which is implied in a statement made in Washington last week by Representative Loudenslager of New Jersey, secretary of the Republican Congressional Committee. He said, speaking of the effort necessary to keep the Republicans in control of the House, that the election of Representatives next year could not be achieved by a simple "Hurrah for Roosevelt!" The magic of that name would be lacking. It is certain, too, that if Bryan is the candidate of the Democrats, there will be no magic on that side, either. A stale and twice-defeated nominee can put no *elixir vitæ* to the lips of his party; a sleeping potion is the most that could be expected from him. The outlook is that the voters will be singularly free, next year, from all kinds of political incantations. No orator will be able to arouse hysterical applause by simply announcing, "I am a Democrat." Nor will a confession of Republican faith move any audience to tears. People will coldly insist upon knowing what kind of Republican, as what kind of Democrat. And if either party thinks to lay a spell upon the citizens of the country, whether by some kind of hocus-pocus of issues, or the fancied glamour of a personality, it will be doomed to a sorry disappointment.

Sober-minded and independent Americans cannot regret the prospect of a campaign in which reason bids fair to have much more play than usual. In our recent financial disturbances, the demagogues and quacks fell suddenly silent. Nobody wanted to hear from them. It was the men who knew, and who had steadiness and power, to whom the people looked. And it may well be that in the disturbed political conditions which we are fronting there will be a similar demand for grave and well-poised men. They may not be able to feed excitement, but they can gain confidence. And they may prove that the most effective political magic is, after all, that which is exercised by sound judgment and stern integrity.

THE HIGHER ATHLETICS.

Contemporary interest in the relation of football to faith calls attention to the fact that bodily exercise has from the beginning of history been closely associated with some spiritual idea, whether religious or political. We need not go to the Australian corroboree or the Indian ghost dance for illustrations, or even to the games which the Greeks instituted with specific religious intent. "Muscular Christianity" has a more modern ring, though the idea of it may possibly go back to the time when the sturdy monks from the Egyptian *laurœ* used to invade Alexandria and with their cudgels chastise the Hypatias and Thaises of that sinful town. Rulers and statesmen have always contended that a people's safety rests largely on the physical prowess of its members. Under ordinary circumstances, a nation of athletes will easily overcome a nation of mollycoddles. This was understood by Agesilaus of old Sparta, who pointed out to his soldiers the fair, tender bodies of his Persian prisoners and their costly garments, and said scornfully, "See whom you are fighting, and then for what you are fighting." There are people in England who, alarmed by the alleged decline in the nation's physical stamina, are expecting that some day a second Moltke will address the same words to a German army corps encamped in Hyde Park.

It is not, however, in its development of the bodily capacities of the individual that the chief value of the higher athletics lies. It will be remembered that the Olympian games were to the Greeks a notable symbol and bond of national unity, and it is precisely in cementing racial and national feeling that modern athletics achieves its most useful function. It is hard to say whether any system of Chamberlain preferential tariffs could hold the British Empire so firmly together as the regularly recurrent contests between the cricketers and football players of Australia, South Africa, and New Zealand and the men of Yorkshire, Surrey, or All-England. There has even been a tendency to ground Anglo-Saxon friendship across the Atlantic on international athletic contests; though there, it must be confessed, an excessive preponderance of victories for one side or the other seems to bring about a drop in the intensity of Anglo-Saxon consciousness of kinship. But athletics, to exercise its full unifying force, must be the recreation of more than the small number of persons who can possibly participate in an eight-oared race or a tennis match. In other words, the political value of physical exercise is best displayed, not in teams, but in such organizations as bowling clubs and gymnastic societies. Of this use of the higher athletics we find a striking example in the political situation in Austria-Hungary, as described by Archibald R. Colquhoun in a recent number of the *North American Review*. Speaking of the active propaganda that is being carried on for creating among the various Slav peoples of the Hapsburg realm, and of Europe in general, a sentiment of racial unity, he says:

> The principal organization for keeping these people in touch is a system of gymnastic societies, known as *Sokols*. Branches, numbering over a thousand, are established in all Slav countries, and in communities of Slavs in foreign countries like Germany, France, and the United States. In 1907 they held a meeting at Prague, at which 23,000 of all nationalities attended (five hundred from America), and manœuvred in a manner which surprised the Austrian and Russian staff officers who were present. In 1885, when Bulgaria threw off the Russian tutelage, there was no native organization save the *Sokols*, which, however, numbered 40,000 men, all trained and disciplined, and largely helped to save the situation. . . . They exhibit an amount of organizing and concentrating power at variance with the accepted character of the Slavs.

A few such organizations exist even in Russia where, of course, they do not enjoy the favor of the officials. Yet it was the belief of one enthusiastic Russian at the Prague celebration that if the *Sokols* were well developed in his country, she would have a constitutional government to-day!

Nor are the Slavs the only ones to make use of gymnastics as a political lever. The European nations are quick in borrowing from each other the newest ideas in popular propaganda, and, along with the general strike, the "pacific" strike, the school strike, and the hunger strike, the idea of political athletics has spread widely. Thus the Italians in southwestern Austria have their own gymnastic societies, whose object is as much the acquisition for Italy of the Tyrol and Trieste as actual proficiency in manipulating the dumb-bell and the Indian-club. Some time ago there was published in this country, and repeatedly reproduced, a picture showing some hundreds of young Italian gymnasts going through their exercises in the Vatican gardens in the presence of the Pope. This is evidence that the Catholic organizations are determined not to be left behind by their Socialistic and Masonic opponents. Rumor has it, even, that young King Alfonso has been enthusiastic in popularizing tennis in his country, out of the conviction that the sporting spirit helps to keep a nation in good health. Conceivably it is because the Spaniards prefer to be spectators at games rather than participants, while the English have always been fond of nine-pins, single-stick exercise, and wrestling, that the Armada was defeated.

Athletics is sublimated when it becomes the embodiment of such ideals as Mr. Colquhoun ascribes to the Slav *Sokols:*

> The object of these *Sokols* is primarily anti-German—their basis is the homogeneity of the Slav race, the preservation of Slav languages and culture. . . . No word of German was heard [at the Prague

festival], and at the national theatre a significant tableau was displayed which represented the *Sokols* releasing the spirit of the Slav from the fetters imposed by German influence.

Yet, curiously enough, political athletics is really a German invention. It was Friedrich Wilhelm Jahn, the *Turnvater*, as he is known to all Germans, who in the hour of Prussia's deepest degradation, following the disaster of Jena, hit upon gymnastic training as a means of bringing about his country's physical and spiritual rehabilitation. The enormous success of the *Turner* idea, with the part which it played in the overthrow of the Napoleonic domination, and in the later democratic movement within Germany, is well known. Our own country can show no parallel to the historical *Turnvereine*; but the advent of the college athlete into politics, most often as the guardian of the purity of the ballot in one of the Tammany districts, together with such phènomena as the election of a Milwaukee county judge on his star record as a halfback, is not a bad sign.

A COLLEGE UTOPIA: A FANTASY.

In commenting on the gift of several millions of dollars to Swarthmore on condition of abandoning intercollegiate contests in athletics, a correspondent has urged acceptance of the money, on the ground that some college should deliberately try the experiment of favoring scholarship as against athletics. The institution, he admits, "might lose popularity for a time," but he thinks that in the long run it might "attract the class of students which is most desirable." This revolutionary suggestion is worth more detailed consideration. We are aware that the great majority of our colleges must, as our correspondent says, "conform more or less to popular sentiment"; that the president, the faculty, and the trustees do not dare run counter to the feelings of the undergraduates and those noisy and half-baked young graduates who yell for the athletic teams and who are supposed to voice "alumni opinion." Yet we can conceive of a college—of course as an abstract ideal, impossible of realization—in which the authorities estimate the tumult and the shouting at their exact value, and steadily pursue the true aims of education. This academic Utopia, a mere dream, we shall describe more fully, fortified by President Woodrow Wilson's recent declaration that the world needs more dreamers. This conception of ours, we may add, is by no means original. It has been seriously presented in private conversation by an eminent educator, whose name we withhold in order to save him from ridicule.

For a site we should choose some city or town in New England, because traditions of culture there are so old and well-established that an institution singly devoted to it may be less likely to excite hostility than elsewhere. Boston and its suburbs are out of the question; for Harvard already has a long start and overshadows everything. New Haven is also impossible: people there would not tolerate a college that was indifferent to the activities to which the Yale of to-day owes its chief distinction. The college which we have in mind might be built on the ruins, say, of Bowdoin, or of Dartmouth, Brown, Amherst, Williams, Trinity, or Wesleyan. Each of these colleges has a considerable "plant" which might, under certain conditions, be utilized for higher education.

The first of these conditions is a strong faculty. At present our smaller colleges are constantly raided by the larger, which offer higher salaries, better equipped libraries and laboratories, and in general wider opportunities for fame and usefulness. Every small college has a few able men who, because of inertia, loyalty, or social ties, are not to be tempted away; but in general the more promising members are steadily drained off. In order to hold them, the small college should pay salaries of $5,000 or $6,000, so that its teachers might buy books, might attend the annual meetings of scientific and literary associations, and might go to Europe in summer, to visit the Bodleian, the Bibliothèque Nationale, and the principal art galleries. Moreover, the professors should not be overburdened with teaching, but should have a fair chance for scholarly research and production. To maintain a large faculty on these terms would be impracticable; and accordingly the college would be forced to the plan which has had such admirable results in the Canadian colleges—the plan of giving comparatively few courses, and giving those well. This would mean cutting off most of the feebly conducted graduate work—leaving that to a real university—and concentrating energy and ability on the important courses in classics, modern languages, philosophy, history, economics, mathematics, and the sciences. The college would not be so big on paper, but its product might be far more completely finished. If a faculty made up of men of intellectual distinction could be held together for a generation we should have an institution unique in its kind—a Johns Hopkins for undergraduates.

That would, of course, imply a body of ambitious students, and a code of discipline based on that ambition. We would by no means bar athletics, college journalism, glee clubs, and social gatherings. All these have their place in a scheme of education; but they are, after all, subsidiary to the main issue. Such a college as we have sketched might lift from the shoulders of its teachers a great burden by sweeping away all committees on football, glee-club concerts, and junior promenades, and by telling the students to play and sing and dance as they pleased within the limits of good behavior. And with this further proviso: that no athlete or singer or any other student should receive the slightest favor in the way of extra absences or postponement of recitations or examinations. If any college faculty should maintain a fairly strict standard of scholarship, inevitably the social, athletic, and other activities would be subordinated to their proper place. As matters are now, the amount of study done by the average undergraduate is, as a Harvard committee reported in 1905, "discreditably small." Almost any man fit to go without a keeper can, with fair application, get through almost any college. But the place we have in mind is intended for youth of intelligence and aspiration. The rest, who constitute the bulk, can betake themselves to other colleges, where, to borrow a phrase from President Wilson, the authoritics "put down the standard of entrance requirements to get men in, and then put down the standard of instruction to keep them in."

Our ideal college we have spoken of as a mere dream—and yet with the backing of a few millions from some one who can distinguish between genuine and imaginary discipline of the mind, one at least of the smaller New England colleges might translate the vision into reality. The college would definitely cease to compete with the others in athletics or in mere numbers. It would content itself with small but picked classes. It would educate them instead of allowing them to idle through four years. Such an enterprise would attract to its faculty scholars of the first rank, who are sick and tired of adapting their instruction to the requirements of football players and other incompetents, and of resisting appeals from the athletic committee to give the shortstop "one more chance." Such an enterprise would also appeal to youth who are worth teaching. If there were money to carry the undertaking through the period of depression, the panic occasioned by a sudden change of policy, it might accomplish great results.

*THE ROMANS IN ISTRIA AND DALMATIA.—I.

AUGUSTUS AND THE DISCOVERIES AT SALONA.

We generally associate this capital of Roman Dalmatia with the name of that distinguished Dalmatian, the Emperor Diocletian, greatest politician since Augustus. He was born at Salona, and when he abdicated in 305 A. D. returned here to live as a private citizen and grow cabbages in the magnificent castle villa which he built near by, in which the mediæval town of Spalato now nestles. Salona

*Other articles in this series appeared in the issues of the *Nation* for May 30, August 8, and September 5.

steadily grew until in the fourth and fifth centuries it was one of the largest cities of the Roman world, half as large as Constantinople; but if the scholars who have haughtily curled the lip at any references to the Roman Salona because they think it a city of the decadence, were to study its ruins without preconception, especially as they are now being laid bare, they would find reason to revise their opinion and recognize a large nucleus of the Augustan age and some remains even of the earlier Greek city, so well described in Dio's history of the civil war. I shall confine myself to the early Salona of Cæsar and Augustus and its share in the Augustan scheme.

Salona's history is Greek in its beginnings. The Greek colonists had crept up the coast line, settling on the islands. From the mother-colony on the island of Issa, the cities of Tragurion (modern Trau) and Epetion had been founded, and from them Salona, only a few miles southeast of Tragurion. The road connecting Salona with Tragurion, called the Via Munita, with its Cyclopean retaining wall, is the oldest known Dalmatian road. The acropolis of the Greek Salone can still be traced; its walls, built perhaps at the time of the wars of the close of the third century B. C., between the Illyrians and the Romans, were then unprovided with towers, and Dio's text shows that temporary wooden towers were added for defensive purposes in the civil war. Already in 119 B. C. the consul Cecilius Metellus, in conducting his campaign against the Dalmatians, had made his winter quarters at Salona, showing its importance as a military centre. Still, in the vicissitudes of war, Salona fell into the power of the native Dalmatian forces and had to be captured several times by the Romans: in 78 B. C. by Cassonius, in 39 by Asinius Pollio, and in 33 by Augustus himself.

After the battle of Philippi in 42, Augustus had received Illyria as part of his share of the West, and it was in the course of the campaigns of his lieutenant, Pollio, to subject it that Salona was delivered from the hostile Dalmatian occupants in 39 B. C. It was either then or toward 33 that Augustus raised it to the rank of a colony under the name of Iulia Martia Salona, and added a Roman city by the side of the Greek, with a wall surrounding the whole and connected with that of the Greek acropolis. Even thus enlarged, the city was relatively small. How it afterwards grew is marked by two successive additional systems of fortifications, one under Marcus Aurelius, in 176, when the army threw up walls to defend the city against the threatened irruption of the Marcomannian hordes, and another in the fourth and fifth centuries, when new bulwarks of exceptional strength and extent were built against the Goths by the Christian emperors.

Of the Augustan city there are almost certainly three relics, and probably others will appear during further excavations. They are: (1) the Porta Cæsarea and part of the walls; (2) the Amphitheatre; (3) the Aqueduct. In the present muddle of the city's topography, when nobody seems to have a tenable hypothesis as to what was the early and what the later portion of the ancient city, I think these landmarks may give the clue. The excavations are now in full swing and of unusual interest, though so modestly done that they receive scant attention. The excavator is the indefatigable Monsignor Francesco Bulic, who is the guardian of Dalmatia's archæological interests and has done so much to save Diocletian's palace at Spalato from disintegration and is still busy freeing it from modern accretions. Salona was practically unique in the completeness of the preservation of the ancient city not only throughout the Middle Ages, but even, except for the destruction of the wars of the thirteenth century, through the Renaissance. The great Christian basilicas subsisted by the side of the hardly injured theatre, amphitheatre, and walls of Roman times. In the seventeenth century, however, the Venetians decreed the final demolition of the old city to prevent its use by the Turks! The Venetians, as usual, laid sacrilegious hands on all its splendid buildings, for use in modern structures, even in Venice itself.

Modern excavations were carried on under Lanza (1821-1827) and Carrara (1842-1850), who uncovered parts of the theatre, the Porta Cæsarea, the Porta Andetria, the wall circuit, the amphitheatre, and a small part of the Christian antiquities. In 1874 excavations were resumed and had been continued intermittently and with small means before Bulic's energy found a better way. Until recently the chief results have been the uncovering of an imposing group of Early Christian monuments of all sorts belonging to the age when Salona had grown to be a metropolis. The greatest known open-air Christian cemetery with its multitude of stone sarcophagi and inscriptions was found, with a large basilica as its centre. This, of course, was outside the city walls; then there was uncovered the episcopal basilica within the city, with all its annexes—baptistry, confirmation hall, episcopal palace, and hospice. There is no group of Christian antiquities outside of Rome and Ravenna that carries one back so thoroughly to the high tide of the Christian life of the fourth and fifth centuries. We see here the very cemetery from which the bodies of the Dalmatian bishops and martyrs were taken in 640 to Rome to be buried in the Lateran Chapel of S. Venanzio on account of the barbarian invasion that threatened the existence of the Dalmatian cities.

But now the earlier ruins are claiming renewed attention, and this summer, as well as last autumn, the main centre of work has been the city gate called Porta Cæsarea, a structure already partly cleared in Carrara's excavations of 1849, but soon reinterred without thorough investigation. During the past season the east face and part of the passage were freed, and several fragments of an Augustan inscription were found, as well as so many parts of the memberment that I hope to be able to reconstruct the design of this important structure. Far from being a work of the decadence of Roman art, this gate can now be proved to be in the style of the other large Augustan gates at Nîmes, Turin, Aosta, and Verona, most of which I have described in other articles. It is a small fortress with a central court. The gateways themselves are triple on each face, and the outside, or east face is flanked by two large projecting circular towers, which have caused great confusion in the minds of archæologists because they were separate from the walls in construction, were used as aqueduct reservoirs, and projected into the *interior* of the city. But what became the interior in the time of Marcus Aurelius, when the new and larger wall circuit was erected to enclose the east suburb, had been the exterior in the time of Augustus, when the city was less than half its later size. The city had expanded eastward in these two centuries of *pax romana*, when the old Augustan practice of fortifying the colonies had been totally abandoned. It was only when the great onslaught of the Marcomanni and Quadi came in 169 that it was necessary to refortify this northern bulwark of the empire, enclosing the suburbs. The army itself has left inscribed records of how and when it did this work. In the new circuit the place of the old Porta Cæsarea was taken, much farther eastward, by the gate, of which a part still remains, called Porta Andetria, through which the principal highway, the Via Gabiniana, entered the city. The new wall followed the line of the Augustan (or Cæsarian?) aqueduct, which had ended by hiding itself in the bowels of that part of the primitive Augustan wall stretching on both sides of the Porta Cæsarea, whose great defensive towers henceforth served merely as reservoirs, and the gate itself merely as a spectacular access to the acropolis from the interior of the city.

As for the aqueduct, which was connected both with the Porta Cæsarea and the amphitheatre, its lead pipes bear the significant names of the makers, Julius Eucarpius and Caius Julius Xantus, proof enough, in the mere use of the name Julius, of the Augustan age for its original construction, which is of superb masonry of early type. Not enough can be seen of the theatre or the public Thermæ for me to offer any conjecture as to their age, but the excavations may soon provide more data.

Fragments of the dedicatory inscriptions of the Porta Cæsarea have come to light, some in the excavations of Carrara (1849) and many more during the past years. It had long been known that the gate was restored under the Emperor Constantius, between 337 and 350, by his governor of Dalmatia, Flavius Rufinus Sarmentius, but I should judge that the restoration was a slight one, affecting perhaps only the upper section. What is far more important than this late inscription in small letters is the finding of numerous fragments, mostly minute, of charaeteristic, large Augustan characters from the original dedication. I shall not attempt to reconstruct it now, because new fragments are appearing, and in any case it would not be fair to Monsignor Bulie, but I can safely reproduce enough of the letters to prove their Augustan' character: IMP [*Cæsar, divi. f. A*] VG [*usto po*] NTI [*fici maxi*] MO [*t*] RIB [*p*] O [*t*] I. I am expecting shortly to return to Salona, when the gate is entirely eleared, and in the passageway and in the west side more of the Augustan inscription recovered. The entire structure is in good-sized, carefully cut, blocks of stone; the mouldings are simple, the Corinthian capitals of excellent *facture*, the proportions quite imposing.

It is with considerable diffidence that I

venture to claim the amphitheatre for the reign of Augustus. It was in 1850 that the excavation was begun, and the digging went in some parts to a depth of over twenty feet. Its major axis is 65 m., its minor 47 m., which makes it slightly larger than that of Pompeii. The probability is that the seats were entirely of wood; their ashes were found by the excavators. Monsignor Bulic asked me to consider carefully the style of the amphitheatre. No inscription has been found that would give any clue to its age. It stands at the west end of the primitive part of the city, and is so small that it was evidently planned for a city of quite limited area, certainly far smaller than Salona had become in the age of the Antonines, as we are constrained to judge from the area enclosed in the walls of Marcus Aurelius. This indication of an early date would be inconclusive if it were not for the primitive style of the arcades, their heavy proportions, and the absence of the tooling or boss-work familiar to us after the time of Claudius. On the other hand, the amphitheatre at Pola is a good example of early Antonine work in this region, perhaps of Trajan's time, and a comparison with its developed forms makes the Augustan age seem exceedingly probable for the amphitheatre of Salona. The majority of critics will be exceedingly skeptical, I know, of so early a date, and loth to recognize here a unique link between the solid pre-Cæsarian type of amphitheatre, as represented by those at Pompeii and perhaps at Sutri, and the open-arched Imperial type of the Claudian and Flavian era, as shown at Capua and the Colosseum. But I think that the work tells its own story to an expert in architectural history.

In another letter I expect to outline the way in which Augustus set about establishing and fortifying Roman colonies at the principal seaports from Aquileia to Thrace, and connecting them by a seaboard highway that reached to Italy; how he founded a few colonies along the main inland natural routes toward the Danube and protected them with military camps. He began his work here in about 40-39 B. C., and gave to it some fifteen years of his attention before he began to concentrate for another fifteen years on the other half of the general scheme of imperial offence and defence in the west—the north Italian scheme which I sketched in my previous articles. But the work was concentrated at first on the northern section, to connect Aquileia with the Danube, and the Illyrian *hinterland* was left largely untouched until the great Dalmatian insurrection under Bato in 6-9 A. D. had shown how dangerous it was to allow the native levies time to come together and prepare while the Roman armies were hampered in their powers of observation and rapid movement. In order to make this impossible in the future, Tiberius, who had himself crushed the rising, which had threatened Italy itself, then carried the early Augustus road scheme practically to completion. In this system there were four main arteries, military or commercial, centring at Salona. The west branch first utilized the old Via Munita to Tragurion and then touched at all the seaports till it reached Aquileia and joined the Italian network and the northwest route to Vindobonum. The second road was that directly northward by way of Clissa and Andetrium over the mountains. It was called Via Gabiniana. The eastern artery passed Via Æquum and the Save to join the future Pannonian road system. At Pons Tiluri it sent out an offshoot into the Balkan fastnesses, while another branch turned southward to old Narona. The least important was the southeast coast road by way of Epetion. The Dalmatian milestone inscriptions indicate that, as we should judge by historic records, very little was done to the Dalmatian roads between Tiberius and Trajan. Vespasian decided to transfer some of the Dalmatian legions northward to Pannonia, and so diminished the military importance of these highways. But under Trajan they became a paramount preoccupation in preparation for his Dacian wars; this is a fact not generally understood, and so interesting a glimpse of Roman politics that I shall leave it for another letter.

NEWS FOR BIBLIOPHILES.

The thirteenth annual volume of "American Book-Prices Current," containing the records for the season of 1906 and 1907, has just been published by Dodd, Mead & Co. A change in type, by which titles are in lower case black-face, and names of authors in capitals, is an improvement. Records are given of 12,700 lots of books and autographs selling at $3 or over—nearly 2,000 less than in the 1906 volume, but more than in any previous issue. Though rare and high-priced books appeared in many sales, there were few extensive libraries of first editions. One such, indeed, that of Louis M. Dillman of Chicago, is notable. Of collections of Americana, that of ex-Gov. Samuel W. Pennypacker, one of the richest in the country, is preëminent. The small number of books from private or semi-private presses is noticeable. Only 23 items from the Kelmscott Press are included, while the 1901 volume records over two hundred; there are only 14 from the Essex House Press, while the 1902 volume includes 52. Though the very rarest books in the finest condition are increasing in price, inferior copies of commoner books are becoming cheaper. This is notably the case with first editions of American authors. The books of Longfellow, Hawthorne, Lowell, and others which were published after these men became famous, were printed in large numbers and can never become rare. To bring the prices paid five or six years ago, copies would now have to be in pristine condition, exactly as new.

On December 10 the Anderson Auction Company of this city sells a collection, mainly Americana, containing the library of a Western collector. Among the lots are a copy of the Aitken Bible, Philadelphia, R. Aitken, 1782 (the first Bible in the English language printed in America), some leaves mended and repaired; Hubley's "American Revolution," 1805; Filson's Kentucky, London, 1793, with the London map; "History of the Lewis and Clarke Expedition," Philadelphia, 1814, the first edition, edited by Nicholas Biddle, in boards, uncut; Martin's "History of Louisiana," 1827-29, boards, uncut; Moultrie's "Memoirs of the American Revolution," 1802; Neal's "History of New England," 1720, a presentation copy; Smith's "History of New Jersey," 1765; and Haywood's "Civil and Political History of Tennessee," 1823. On December 12, the same firm offers some selections from the library of the late Dr. William Egle, State Librarian of Pennsylvania. There are books on New Sweden, by Acrelius, 1759, and Biorck, 1731; McCall's "History of Georgia," 1811-16, a presentation copy; Livingston's "Review of the Military Operations in North America," 1757; Penn's "Further Account of Pennsylvania," 1685; and Loudon's "Narratives of Outrages committed by the Indians," 1808-11.

Macmillan & Co. announce as forthcoming "Suppressed Plates," by George Somes Layard. He discusses in detail the history of some famous suppressed plates; such as the portrait of the Marquis of Steyne, which appeared in a few early copies of "Vanity Fair," some of the cancelled designs of Hogarth, Cruikshank, Keene, and other artists. The volume is to be illustrated with reproductions of a number of plates.

Correspondence.

FRANCIS THOMPSON.

TO THE EDITOR OF THE NATION:

SIR: The death of Francis Thompson on November 18 will start strange thoughts in the minds of lovers of English poetry. How easily we forget! In the year of the publication of his "Poems," 1893, his was the name most discussed in the gatherings of the literary. Perhaps no poet's first book, not even Swinburne's "Poems and Ballads," had provoked more discussion or been more generally acclaimed. Coventry Patmore, writing in the *Fortnightly*, boldly declared that the level of his achievement was higher than Crashaw's. H. D. Traill likewise aligned him with the classics, and most wonderful of all, the *Edinburgh*, forsaking its tradition, heralded the arrival of a great singer hitherto unknown. Then came stories of the struggle Thompson had made, of the many defeats, how he had taken to the anodyne of Coleridge and De Quincey, how he had been found holding horses in London, and what not. Then there was the fascination of his religion and the rumor of his withdrawal from a hopeless world into a monastery in Wales.

How true all this was we do not know. Yet it is certain that he who had written "The Hound of Heaven" had passed through deep waters. He was no longer young for one publishing a first volume, and the book itself was not large. Its quality, however, was unmistakable. The manner, too, was new, though in a sense it was as old as Donne or Cowley or Crashaw. No nineteenth-century poet's soul had been so uneasy in its body; none had felt such spiritual torture, not even Verlaine in the prison at Mons. Here was a new accent:

I dimly guess what Time in mists confounds;
Yet ever and anon a trumpet sounds
From the hid battlements of Eternity,
Those shaken mists a space unsettle, then
Round the half-glimpsèd turrets slowly wash again:

This surely was authentic. The nineteenth century had not heard many such bursts of song, none ever on such a theme. In the temperament of its maker there was

a strange interpenetrating of the ascetic and the æsthetic, hungry yearnings that seemed directed at once at heaven and the flesh; now a passionate spirituality and a shrinking horror of the earthly that sounded like an echo of St. Bernard's "Preparation for the Last Judgment"; then again rhapsodies like the "Corymbus for Autumn," clogged with impossible adjectives that troubled till they cloyed the sense; or clear startling renditions as in his "Poppy":

Like a yawn of fire from the grass it came.

He could be tender, too, and his poems on childhood are among his best. If we dared pick, for instance, only the following four stanzas from his "Daisy," it would be a well-nigh perfect lyric:

For standing artless as the air,
And candid as the skies,
She took the berries with her hand
And the love with her sweet eyes.

The fairest things have fleetest end:
Their scent survives their close,
But the rose's scent is bitterness
To him that loved the rose!

She looked a little wistfully,
Then went her sunshine way:—
The sea's eye had a mist on it,
And the leaves fell from the day.

She went her unremembering way,
She went and left in me
The pang of all the partings gone,
And partings yet to be.

The lines quoted are enough to show that the future will have some reckoning to make with their author. Yet he had many and grave defects. His execution is often inexcusably wretched; he cannot strike his note and hold it; when hard pressed he stuffs the gap with monstrous words and his ear fails him. The technical accomplishment which is always there to save Verlaine's worst is not evident even in Thompson's best, and it is perhaps for this reason that he has fallen so hopelessly far behind even his own deserts.

His first success he followed up with "Sister Songs" in 1895, and with the "New Poems" in 1897. There was no progression; he was no longer a "new poet," and the faults seemed more glaring now that the public's first ardor had cooled. Perhaps he was disappointed, perhaps—and we strongly suspect it—that complex of contradictory qualities which constituted his temperament was unstable, and when the resolution came, as it must have come with years, the *furor poeticus* was gone. In any case, the poet lapsed into silence, and doubtless it will mean little to the latest generation of readers to learn that Francis Thompson is dead. CHRISTIAN GAUSS.

Princeton, N. J., November 25.

"THE FRUIT OF THE TREE" AND IBSEN'S "ROSMERSHOLM."

TO THE EDITOR OF THE NATION:

SIR: In reading Mrs. Wharton's new novel, "The Fruit of the Tree" (reviewed in the *Nation* of October 17), I have been struck with its similarity in central situation to Ibsen's play, "Rosmersholm," a similarity, so far as I know, not yet pointed out by the reviewers.

In "Rosmersholm" the hero, Rosmer, is an idealist and would-be reformer, whose wife is incapable of sympathizing with his high purposes. The wife, Beata, has a friend, Rebecca West, who has become a member of the family, has developed an intimacy with the husband, and is fully in sympathy with him. In fact, Rebecca is largely responsible for Rosmer's new philanthropic theories and plans. She is a young woman of strong personal charm. "Whom could you not bewitch, if you tried?" one of her enemies says to her. She is also in love with Rosmer, and sees that he will never accomplish anything while his wife lives. Beata is a nervous invalid. By skilful suggestion Rebecca makes her believe that her death is necessary to make Rosmer happy, and to preserve him and Rebecca from shame. The unhappy Beata throws herself into the river. Rosmer soon discovers that he is in love with Rebecca, and asks her to marry him; but under the conventional influences of Rosmersholm Rebecca has experienced a change of heart. She now believes that she has no right to marry Rosmer, and steadfastly refuses him, but without giving him any reason for doing so. Finally, after some pressure from without, she confesses her responsibility for Beata's death, at the same time declaring her love for Rosmer. Rosmer is in theory an emancipated man; but, as his friend Kroll says, "All this has only been a matter of the intellect; it has not passed into the blood." He is horrified and repelled by Rebecca's confession: at once he loses all faith in her. One thing only can restore his faith: that she should "go the same way that Beata went." She expresses her willingness to do so; he is incredulous, but at the last moment is convinced of her sincerity, and leaps into the river with her.

From this bald account of the play the extent of its similarity in situation to the novel will be evident. The three central characters of "The Fruit of the Tree" stand in the same relations to one another as Rosmer, Beata, and Rebecca. Amherst, like Rosmer, is a man of "advanced" thought, an idealist and would-be reformer. Bessie, like Beata, is incapable of sympathy with her husband's theories. Justine Brent, like Rebecca, is a friend of the wife who comes into the family, becomes intimate with the husband, and sympathizes with his aspirations. Like Rebecca, she is a girl of singular personal charm and persuasiveness. "There's nothing you can't make people believe, you little Jesuit!" Amherst says to her. To save Bessie from needless anguish, Justine gives her an overdose of morphine. Afterwards she marries Amherst. Her motive, unlike Rebecca's, is unselfish, but the outcome is the same that Rebecca planned. Like Rebecca, Justine conceals her share in the wife's death as long as she can. Amherst distrusts the woman he loves, as Rosmer does, when she makes her confession. "Like many men of emancipated thought, he had remained subject to the old conventions of feeling." There are obvious and important differences, illustrating in an interesting way the difference between Norwegian and American taste; but the parallel is sufficiently noticeable.

Of course, there is no question of plagiarism. The resemblance may be entirely accidental; and in any case Mrs. Wharton, by her masterly treatment, has made the situation her own. But I think it would not be difficult to trace Ibsen's influence elsewhere in her work. Lily Bart, for instance, is a sort of American Hedda Gabler. At all events, the similarity I have been speaking of seems worth pointing out.

HOMER E. WOODBRIDGE.

Colorado Springs, November 17.

JOHN HARVARD AND HIS TIMES.

TO THE EDITOR OF THE NATION:

SIR: Your critic's kindly reference to me in his review of Henry C. Shelley's "John Harvard and His Times," November 21, prompts me to say that if I was not the discoverer of our John Harvard's English home and parentage then certainly Dr. Rendle was not, and the credit must be awarded to an earlier explorer, viz., the late Col. Joseph L. Chester, who first called attention to the fact that there was a butcher in Southwark named Robert Harvard, who, dying in 1625, left, among other children, a son John. It was in the winter of 1881-2 that Chester made known this fact and suggested that this John Harvard might have been the one who came to New England and gave name to our ancient college. If the mere fact that there was a John Harvard in Southwark of apparently the right generation is enough to warrant the declaration that he was our man, then, I repeat, Col. Chester is to be credited with its discovery. But that gentleman was a trained genealogist, and knew very well that proof was needed to establish the connection, and that the one who should find that proof would rightfully be acclaimed as the real solver of the problem.

From Col. Chester not only I, but many others, knew that John, son of Robert Harvard, was living in 1625, and we took it for granted that his baptism would have been entered upon the parish register. I could have gone for it any day from the moment I first settled down to my work in London, with the confident expectation of finding it, as I did two years afterwards; but I should have been no nearer to the solution of my problem. The parish register could not tell me anything about that. There were other Harvard families, other John Harvards. Who was *our* John Harvard? That was the question to which I was trying to find the answer, and I found it, as I had expected, in the probate records. When the wills of Thomas Harvard and Mrs. Katherine Yearwood were found, the English home and parentage of our John Harvard ceased to be a problem. It only remained for me and others, including Messrs. Rendle, Smith, Dunkin, etc., to glean additional facts in our various fields, and thus increase our knowledge of the man and his surroundings. One of these additional facts, of course, was this very record of baptism, which then, and then only, became important (in the sense of interesting), since it enables us to form some idea of his age, and furnishes us with a date to celebrate a Founder's Day.

What caused me regret was Mr. Shelley's reference to what he was pleased to term an "ungenealogical wrangle" between Dr. Rendle and me. He is mistaken. I never engaged in a wrangle, or whatever else it may be called. He has evidently confounded me with the late Mr. John F. Hassam, who had my "Gleanings" published and furnished the Introduction, to which undoubtedly Mr. Shelley refers. The

first I knew of that Introduction was when the finished pamphlet reached me. My connection with the work had ceased when I sent my notes across the ocean to the society. I was sorry to see Mr. Hassam's first comments, just as I have been sorry since to see a portrait of me inserted in one of the bound volumes of my "Gleanings." In both instances my consent was not asked, nor was I informed beforehand.

Before closing let me call attention to a fact not noticed, so far as I know, by anybody thus far. The Rev. Nicholas Morton, minister at St. Saviour's and close friend of the Harvards, dying in 1640 left a will of which I made an abstract which appears in my "Gleanings." That will shows that he had recently married the widow of John Harvard's brother Thomas. This is especially interesting in view of the fact that Charles Morton, his eldest son by a previous match, later (in 1686) following in the footsteps of his father's friend and brother-in-law, came over to New England, settled in Charlestown, became a minister of the church there, and also vice-president of the college named after that friend.

HENRY F. WATERS.

Salem, Mass., November 22.

THE "STATE PAPER OFFICE" AND THE PUBLIC RECORD OFFICE.

TO THE EDITOR OF THE NATION:

SIR: It is a remarkable fact that reputable historical writers of the present day should continue to refer to documents in the "State Paper Office," London, when that repository has had no legal existence for more than fifty years and no material existence for forty-five years. In Larned's "Literature of American History" (Paul Leicester Ford's contributions), 1902, Greene's "Provincial America," 1905, Munro's "The Seigniorial System in Canada, "1907, and Avery's "History of the United States," Vol. III., 1907, not to mention less important publications, the term is still used, and the impression is left that there is in London to-day a "State Paper Office" containing valuable documents and maps relating to American history.

Were it not that this error has been repeated so often by scholars of rank, it would not seem necessary to call attention to it here. The facts are these: In the middle of the nineteenth century, except for a few scattering groups of papers, the great bulk of the State Papers, Domestic and Foreign, the Home Office and Colonial Office papers, and the papers of the Board of Trade, were in the State Paper Office, a building erected for the special purpose in 1830, fronting St. James Park, where the India office now stands. In 1848 the decision was reached that on the retirement of Sir Henry Hobhouse, the Keeper of the State Papers, the records should be transferred to the custody of the Master of the Rolls; and on March 5, 1852, an order in council was issued requiring "that all records belonging to Her Majesty, deposited in any office, court, place, or custody," other than those mentioned in the Public Record Office Act of 1838, should "from henceforth be under the charge and superintendence of the Master of the Rolls," subject to the provisions of that act. When, therefore, in 1854, Sir Henry Hobhouse died, the State Paper Office and its establishment were consolidated with the Public Record Office, founded in 1838. The former maintained a separate existence as a branch Record Office until 1862, when the site being required for the new Foreign and India offices, the building erected thirty-two years before was pulled down and all its contents, not already removed, were transferred to the building between Chancery and Fetter Lanes.

The term "State Paper Office" as indicating a separate record repository is, therefore, wholly incorrect, while its use as a synonym for the Public Record Office is misleading and without official warrant.

CHARLES M. ANDREWS.

Johns Hopkins University, November 21.

REDUCING THE DUTY ON ENGLISH ART

TO THE EDITOR OF THE NATION:

SIR: I notice this morning that a "provisional agreement" has been "arrived at" between Mr. Whitelaw Reid and Sir Edward Grey, to swap British art for American drummers' samples, by a reduction of the duty on English art. No American artist in Europe is—if he is worth anything—afraid of competition in Europe, where there is at present no tariff, though there is a certain amount of justifiable jealousy towards Americans. But, if this agreement is carried out, and if the duty on British art is alone to be reduced, and not that on Continental art, the result will simply be that British shop-keepers—I mean experts—and British painters who can't dispose of their work here or on the Continent, will have a better chance of dumping their unsalable remainders on hypnotized Anglomaniacs—I mean American art lovers.

As a matter of fact, the tariff has never kept the work of an eminent, an acknowledged European artist, out of the country. Has it kept out the Romanticists? Where are the best collections of Monet? In my own work, what European etcher has been prevented from showing and selling his prints? What illustrator from contributing to the American magazines? The tariff has kept out cheap and unsalable rubbish. It has never for one moment interfered with a modern, a living European artist. I have been connected with more than one American show of European art, and I know what I am talking about.

But if England is to be given a preferential arrangement, what will happen? France, Germany, Italy, who alone have helped America in this struggle, will, I hope, prevent American artists from ever showing, from ever studying, and from establishing schools, clubs, and students' refuges in those countries. What has Great Britain done for American art that it should be toadied to? Nothing—nothing—less than nothing. True, the Academy has from its beginning been a harbor for American painters—some of them. But has England welcomed American artists to its schools? To be sure, these schools are not worth attending. Even Englishmen who wish to learn anything go to France. Has the British nation encouraged American—or any other—save its own art? And in payment we are to allow anything unsalable, so long as it is British, to be dumped on us.

What I mean is this: take the tariff off everything—no artist over here would object to that, ridiculously sentimental and inartistic and unbusinesslike as the idea is—or let it alone. But why toady to England, the most inartistic nation on the face of the globe?

JOSEPH PENNELL

London, November 23.

Notes.

The new volume (Part V.) of the Oxyrhynchus Papyri, which is on the point of being issued, contains only literary texts, including a fragment of an uncanonical gospel, the new pæans of Pindar, and the portions of a new Greek historical work, which Drs. Grenfell and Hunt are now disposed to identify with the "Hellenica" of Theopompus. A cheap edition of the gospel fragment by itself, uniform with the "Sayings of Jesus," will be published simultaneously by Henry Frowde. It gives an account of the conversation between Jesus and a Pharisee, on the nature of purity, referred to in the report of the Egyptian Exploration Society, page 516 of this issue.

Prof. Albert Feuillerat of the University of Rennes is preparing a complete edition of the poetry and prose of Sir Philip Sidney. There will be two volumes of text and one of annotations and critical apparatus, published by the Cambridge University Press.

Doubleday, Page & Co. have just reissued Kipling's "Many Inventions," comprising short stories first published in this country by D. Appleton & Co. in 1893; a volume of "Collected Verse," containing substantially the matter in "Ballads and Barrack-Room Ballads," "Departmental Ditties and Other Verse," "The Seven Seas," and "The Five Nations"; and an edition of "The Brushwood Boy," illustrated by F. H. Townsend. We doubt whether the fantasies of "The Brushwood Boy" can ever be translated into line and color; Mr. Townsend, at any rate, has not wholly succeeded.

Miss Laura E. Lockwood, associate professor of the English language in Wellesley College, has now completed her "Lexicon to the English Poetical Works of John Milton" (The Macmillan Company), a part of which was printed several years ago as a Yale doctoral thesis. This is a welcome work and will henceforth be indispensable to any serious student of the poet. It is a matter of regret that so few special lexicons for the great English poets have as yet been undertaken. That the labor involved, though arduous, is not thankless, is proved by the reputation which has long attended the late Dr. Schmidt's "Shakespeare Lexicon." Miss Lockwood has used the text of the Globe edition, and retained the modern spelling; in the arrangement and classification of the meanings of words she has followed the "New English Dictionary." Except in the case of the very commonest words, she has aimed at making her record of occurrences complete, and she has laid particular stress on definitions. Of course, only systematic use can prove

the accuracy of such a book in detail, but the impression which one gains from a cursory examination of its pages is that the task has been accomplished in a reliable and painstaking manner.

We welcome the translation, by Rose E. Selfe, of selections from the first nine books of Giovanni Villani's "Croniche Florentine" (E. P. Dutton & Co.). Her selections include many of the most important episodes, among them the events of Dante's time, and the chapter concerning Dante himself. The translation reads well, without apparently sacrificing accuracy. Marginal reference to Dante's writings make the work all the more valuable for the Dante student. In a brief introduction, the Rev. Philip H. Wicksteed discusses the value of Villani and epitomizes Dante's politics. By giving the titles of the omitted chapters the translator enables one to infer whether they contain matter for him or not.

F. W. Bussell of Brasenose College, Oxford, has followed a new line of Christian apology in his Bampton Lectures on "Christian Theology and Social Progress" (E. P. Dutton & Co.). Instead of examining the Christian revelation in the light of reason, or defending the trustworthiness of its records, he seeks to establish the faith on the basis of its utility. Not reason, or fact, but use furnishes him his point of view. He seeks to exhibit the fitness of the Christian scheme to meet the practical and pressing difficulties of modern men. He pursues his purpose with considerable success, but one may question the value of the endeavor, for the inquiry remains, What is the advantage of demonstrating that a religion is valuable if it cannot also be shown to be true? Nevertheless, Mr. Bussell's pages contain much that is of real value, comments which show no small powers of discernment and penetration. His argument is weakened by his frequent failure to hold himself resolutely to the question in hand. We note that German words, with umlauted vowels, are often incorrectly printed.

A text-book for the instruction of children in "The Life of Jesus," prepared by Herbert Wright Gates (University of Chicago Press), deserves commendation. An accompanying "Pupil's Note Book," for use in class, contains outlines to be filled in, spaces for answers to questions, and for the insertion of pictures. The division and arrangement of the Biblical material are excellent, and the features of real importance are made emphatic. Questions beyond the capacity of children from ten to thirteen are kept skilfully in the background. The effort is to allow the gospels to speak for themselves, without needless intrusion of dogma. Good use is made of Christian poetry. If Sunday-school teaching could be brought to the level indicated by this text-book, much of the reproach under which Bible training suffers would lose its justification.

The efforts on the part of prominent Protestant theologians of Germany to come to some kind of understanding with the more independent representatives of Catholic scholarship in the interests of common scientific research and practical church work, are producing a literature of their own. The well-known university address of Prof. Adolf Harnack, delivered in Berlin on the last anniversary of the Kaiser's birthday, had this for its theme, and attracted wide attention. Now Prof. Paul Tschackert, of the University of Göttingen, has just published a work of 143 pages (Munich: C. H. Beck), entitled "Modus Vivendi: Grundlinien für das Zusammenleben der Konfessionen im deutschen Reich," in which he outlines a plan showing why and how the Catholic and the Protestant churches, without in any way sacrificing any fundamental principles, could yet coöperate in most of the departments of church work, such as charity, missions, social problems, and the like. Tschackert is, however, convinced that such an understanding cannot be reached with the extremists in either camp.

A new organ of the advanced theology in Germany has been established in the monthly called *Evangelische Freiheit*, edited by Prof. O. Baumgarten of the University of Kiel, and published by Mohr, in Tübingen. Its purpose is chiefly to show that liberal thought, because on a friendly footing with modern culture in general, is better able to supply the religious wants of our generation than orthodoxy possibly can do. Practically all the liberal university theologians of Germany are enrolled in its list of contributors. The publishing house of Mohr, which has within the last few years issued more than two hundred thousand copies of the booklets constituting the series of scholarly yet popular expositions of Biblical and religious problems, known as the Religiousgeschichtliche Volksbücher, now announces as supplementary to this series a new monthly journal called *Die Religion in Geschichte und Gegenwart*. This periodical is to be devoted to the discussion of religious questions from the modern point of view, and hence will give much attention to "questions and doubts" that the readers suggest. A similar yet more conservative idea underlies the new quarterly review known as *Die Theologie der Gegenwart*, published by A. Deichert of Leipzig. More conservative still is the new series called Flugblatt für Gebildete, issued monthly by C. Bertelsmann of Gütersloh, in the interest of Christian apologetics. Another new religious paper, *Die Dorfkirche*, which has made its appearance in Germany, has for its province the cultivation of the religious life of the German Protestant peasant, and the assistance of the pastors and teachers of the peasant villages in central and northern Germany in their difficult task of understanding the intellectual and emotional processes of the people to whom they minister. The editor, Hans von Lüpke, a pastor in Thalbürgel, Thuringia, declares that the missionary to the heathen is better equipped in the comprehension of the religious life and usages of foreign races by his university training than is the pastor of a peasant church for effective ministry in his country parish. Religious sentiments utterly strange to him appear in his congregation after years of labor among them, and he finds often to his sorrow that his efforts have been totally misconceived, and that he has wrought injury where he hoped to bestow benefit. No observer of the German peasant will question the truth of this statement. The chasm between the *Bauer* and the city dweller is a wide one. A. l'Houet, author of the valuable "Psychologie des deutschen Bauerntums," is one of the collaborators in the new enterprise, whose progress may be watched with interest.

In "Bilder aus der brandenburgisch-preussischen Geschichte" (Berlin: Spiro), by Dr. Georg Voss, we have a delightful series of sketches of prominent men and important events in Prussia during the eighteenth century, together with eighty-three illustrations consisting of photolithographic reproductions of the etchings and drawings of Daniel Nicholas Chodowiecki, a celebrated and highly gifted painter and engraver of that time, who also held the position of director of the Berlin Academy of Arts. Especially interesting are the anecdotes and incidents connected with the life and carcer of Frederick the Great. The text is entertaining, hut the dellneation of customs and the portraiture of persons hy Chodowiecki, who was as distinguished for his keen psychological insight as for his artistic talent, give the book its chief attraction and value.

At a general meeting of the Egypt Exploration Society held on November 12 in London reports were read of the work during last year's campaign. Deir-el-Bahari, which is one of the most interesting sites in the area of ancient Thebes, has now been completely cleared. In the temple of the Queen the most important discoveries have been the great altar—the first known in Egypt at tbat time—and the "birth-terrace," the inscription of which gave the legend of the divine nativity of the Queen, and the description of her education and her coronation as associate to her father. In the lower part was found the unique representation of the transportation of the two obelisks erected at Karnak, one of which is still *in situ*. Inside this temple were also found the ebony panel of a shrine and its door. The discovery of the funerary temple of Mentuhetep II. is one of the most important discoveries made lately in Egypt. It is in a ruined state, but is the most ancient temple which we possess at Thebes, revealing, as it does, the art of the Eleventh Dynasty. M. Naville, in the course of his address, strongly recommended taking up another large and important work which might last several years, rather than change the site of excavations every year. He thought a worthy undertaking would be the clearing of Abydos, which had already been conceded to the Egypt Exploration Fund. Though several explorers had already worked there, a great deal still remained to be done. It was a field of research which extended from the first dynasties to the Ptolemaic times. Another important work of the year was the complete clearance of the remaining mounds which contained Greek papyri at Oxyrhynchus. These nearly all belonged to the fifth and sixth centuries A. D. In one mound were a number of literary fragments, belonging to a library largely composed of Greek lyric poets. A Gospel fragment gave an account of a conversation on the nature of purity between Christ and a Pharisee, which was supposed to take place in the temple at Jerusalem. It is probably to be regarded as an elaboration of Matthew xv. 1-20, composed between 150 and 200. The most important of the new classical texts consisted of the fragments of

the lost "Hypsipyle" of Euripides. Another long papyrus contained a commentary on Thucydides, Book II., apparently written in the first century, but the authorship has not yet been determined.

The lack of men in the library schools is discussed in the annual report of the New York State Library, now in course of preparation. During the twenty-one years that this school has been in operation it has matriculated 475 students, of which 107, or about 23 per cent., have been men. Of this number several failed to complete the course, and 6 have died, but 75, or three-fourths of those still living, are actively engaged in library work. In but two instances have men left the work after completing the course. The report adds:

That so large a proportion of these men continue in the work is strong testimony to its opportunities for advancement and its reasonable pecuniary rewards.

On this latter point comparison is made with the salaries commonly paid by the colleges and universities to tutors and instructors on the completion of two or three years of graduate work, and the comparison would seem to show to the advantage of the library school graduate, both as to immediate and ultimate return. Among the reasons suggested to account for the hesitation of men, particularly of university men, to enter the field, are the general feeling that library work is woman's work, based on the observation that most librarians are women; the great attraction of commercial pursuits, from which all the learned or literary callings are suffering; but chiefly the fact that library work as a profession has not been brought seriously and directly to the attention of young men at the time when their life work is chosen. To most young men, the report states, the library field has been a *terra incognita* of whose opportunities for executive and administrative ability, for real scholarship, for high social service they have not known or thought. Of late there has been a marked increase in the demand for men:

Men have probably always been preferred for the chief positions, but library salaries have been so small that in library work, as in teaching, the rank and file have been overwhelmingly women. Within recent years, however, salaries have become better, and, coincidentally, has come an increased and steadily growing preference for men as chief librarians. At the present moment the demand for good men to take not only chief places, but the more important subordinate ones, is far beyond the supply.

The semi-annual meeting of the Bibliographical Society of America will be held in Chicago December 30 and 31. The subject of the first session will be the present problems of the bibliography of science. The discussion will be opened by Dr. Cyrus Adler, assistant secretary of the Smithsonian Institution. The second session will be devoted to an illustrated lecture on Printing as a Fine Art by William Dana Orcutt, of the University Press, Cambridge.

A provision of the French Ministry of Education should be added to the notes which have already appeared, regarding the international exchange of academic opportunities. In France, the best educational establishments, the écoles normales, the écoles primaires supérieures, the lycées, and collèges are all under the control of the Ministry of Education. The paid teachers must be men or women of French nationality, holding a degree from a French university, but a limited number of foreigners, men and women, are admitted each year as assistants; and for a number of years English women have been received as student teachers, as *répétitrices* in the écoles normales, of which there are nearly fifty. *Répétitrices* are required to give the students, who are girls from fifteen to twenty years of age, and any teacher who may wish for it, instruction in English and practice in English conversation. They are expected to devote an hour and a half or two hours a day (not over ten hours a week) to their duties as teachers, and in exchange are allowed to attend during the rest of the day the different courses given at these schools—theory of education, French language and literature, science and arts—or to employ themselves as they think fit. They are not allowed, however, to give paid lessons outside the college. They receive no salary from the French government, but are required to pay into the funds of the college 400 francs for the school year of ten months. Such students are treated like the other teachers in these training colleges. Each is assigned a room to herself within the school building, and is provided with board throughout the school year. Candidates must not be under eighteen or over thirty years of age, and must give evidence of having had a good education at school or college. English candidates are required to have passed some examination conducted by a British university. Some knowledge of French is indispensable. American women are eligible to these posts, "provided they speak good English."

The University authorities in Vienna have decided to present Miss Elise Richter, Ph.D., to become a privat docent in Romance languages. This is the first case of a woman securing this privilege in the academic circles of Austria.

Prof. Minton Warren, Pope professor of Latin at Harvard University since 1899, died at Cambridge, November 26. He was born in Providence in 1850, was graduated from Tufts College in 1870, and nine years later received the degree of Ph.D. from the University of Strassburg. Before going to Harvard, he was professor of Latin at Johns Hopkins. He was a director of the American School of Classical Studies at Rome from 1896-7, and president of the American Philological Association from 1897-8.

The Rev. Dr. Wendell Prime, ex-editor of the New York *Observer*, died at Zurich, Switzerland, November 28. He was born at Matteawan, Dutchess County, N. Y., in 1837, and he was graduated from Columbia in 1856. After a course of study at the Princeton Theological Seminary, he entered the Presbyterian ministry, and held pastorates at Detroit and Newburgh. In 1876 he joined the staff of the *Observer*, of which his father, Samuel Irenæus Prime, was editor; and later he himself succeeded to the editorship. In 1893 he retired on account of ill health. He was author of an elaborate monograph, "Fifteenth-Century Bibles," and he edited the "Autobiography and Memorials" of his father.

Two deaths of literary men are reported from Germany. The first is Prof. J. Wormstall, Münster, in his seventy-ninth year. He was author of several historical works, including Über die Wanderungen der Bataver nach den Niederlanden." His "Westphalienlied" gave him some repute as a poet. Julius Gersdorff, who died by his own hand at Weimar, was a lyric poet of considerable popularity. Among his writings are "Spielmannslieder" and "Gruss aus Thüringen."

THE GREAT COMMONER.

William Pitt, Earl of Chatham. By Albert von Ruville; translated by H. J. Chaytor, assisted by Mary Morison; with an introduction by Prof. Hugh E. Egerton. 3 vols. New York: G. P. Putnam's Sons. $9 net.

It is strange that one of the stateliest figures in English history has never yet had an adequate biography. Most Englishmen's views of Chatham are drawn from Macaulay's two consummate essays; and the fact that hardly any writer of the first rank has ventured to follow in Macaulay's footsteps is, perhaps, the surest testimony to the insight which those essays show. Now Dr. von Ruville, a German scholar of great industry, has intervened where angels feared to tread, with an elaborate life of Chatham, in three large, closely-printed volumes, full of carefully accumulated information, illustrated by some interesting portraits. The work is translated in a style which is adequate, if sometimes necessarily stiff, and prefaced by an admirable introduction from Professor Egerton's pen. The volumes show wide knowledge and great pains. Dr. von Ruville has made good use of the Newcastle papers in the British Museum; he has searched the Record Offices in London and Berlin; he is familiar with all the principal modern books upon his subject. He is anxious to be impartial, so anxious that he never fails to emphasize his hero's faults. His knowledge of German politics does not betray him into dwelling too largely on German interests: indeed, his descriptions of Frederick the Great's campaigns are in some places almost colorless and curt.

On two points he has, we think, added something valuable to our knowledge of Pitt. He brings out strongly the share which Pitt was forced to take in the personal intrigues which formed so large an element in contemporary politics, the influence of his connections, of the Grenvilles especially, on his career, and the extent to which for many years he depended on the support of the Prince of Wales and the Leicester House party. And, secondly, Dr. von Ruville succeeds in making Lord Bute's share in English politics clearer than it has been made before. He establishes Bute's desire to work with Pitt as far as possible; and he convinces us that Pitt's resignation in 1761 was not due to the resolve of the new Court to get rid of him at any cost. In some other points also, in his appreciation of the position in America in 1758, in his insistence in Pitt's keen and early interest in military questions, and in the careful account which he gives, both of intrigues at home and of operations abroad—overloaded with detail as both are apt to be—Dr. von Ruville's work deserves respect. It is only when we come to look for breadth of view or width of treatment, for perception, proportion, sympathy, illumi-

nation, in fact for those larger qualities which make history and biography alive, that we are driven reluctantly to the conclusion that the book is unhappily depressing and depreciatory.

It is not upon points of detail that we are forced to pass this unfavorable judgment. For a German scholar writing British history, the slips in actual details are few. That Dr. von Ruville should take seriously the genealogical myth which makes Pitt a descendant of the great Regent Moray; that he should describe Pitt as Prime Minister when he was not; that he should speak of certain politicians as belonging "to the Tory and more radical section of Pitt's following," and of George III., the stubbornest figure in English history, as a "young and pliable King"; that he should do scant justice to "Diamond Pitt," the governor, one of the raciest old adventurers that ever lived—these and similar details are points which matter comparatively little. The want of proportion, again, which leads him to give four lines to the battle of Plassey, and four pages to the capture of Belle-Isle, may be excused in a biography of Pitt. And it is not unnatural that a German writer should fail to grasp what comparatively few English historians have explained, the meaning of the long struggle between the strict Whig Oligarchy and the Tories. On the one side was the party of Walpole and Pelham, of Rockingham and Burke, who were determined to maintain the Whig party system as the only guarantee for Parliamentary freedom; on the other side were Bolingbroke and the Tories, whose theory George III. carried into practice, the theory that the Whig Oligarchy was a usurpation and party government an abuse, and that the proper constitutional system for England was government by the sovereign—a Patriot King—choosing as his ministers notable men from every party, and through them controlling Parliament and putting faction down. It was this latter theory, never fully understood, which played such havoc in eighteenth-century politics, which appealed so strongly to a detached, imaginative mind like Chatham's and severed him from the Whig party, whose natural leader he was, and which enabled George III. to shatter the Whigs and almost to ruin his country.

But our difference with Dr. von Ruville is based on stronger grounds than these. If there is one thing which is true of Chatham, though everything else may be false, it is that he had inspiration in him. Perverse, mistaken, factious, grandiose, he may sometimes have been, though our conviction is that, when his true biography comes to be written, it will show him a much simpler man than some people suppose—but he was above all else what Carlyle calls him, "radiant," lofty in character, ambition, and desire. In reading Dr. von Ruville's elaborate volumes we hardly ever get a hint of this. In these pages—incredible as it may seem—Pitt is little more than a versatile and intriguing politician, bold and powerful, it is true, in action, but constantly failing in policy, in counsel, in debate, and all through life beset and often gulded by personal motives of the most pettifogging kind. To show that this is not an exaggerated criticism, we will take his character as Dr. von Ruville draws it here. Because Pitt warns his nephew against vice, Dr. von Ruville declares that "he certainly felt himself guilty" of immorality and excess in his own youth (Vol. I., p. 89). As a speaker, he indulged in "mob oratory" because he "calculated" that the public were incapable of judgment (II., 65); and many of his speeches, in which his best arguments were often not his own, were "especially deficient in depth of thought and clearness of perception" (I., 149). Dr. von Ruville does not hesitate to criticise, in this fashion, on the basis of eighteenth century reports, speeches which all who heard them agree were unmatched for fire and force in the records of Parliament. When Pitt expresses his admiration for the great Frederick of Prussia—an enthusiasm so real that all his family grew up to believe in Frederick as a hero, and on the news of Liegnitz the Hayes bells were set ringing and Pitt's two baby boys rushed in to their mother with huzzahs—Dr. von Ruville suggests that he is trying "to provide a plausible motive for his conversion to the Continental policy of Newcastle" (II., 91). When Pitt, almost alone among Parliamentary leaders, protests against the unjust treatment of Admiral Byng, Dr. von Ruville accuses him of "vacillation and timorousness," and explains that, while unwilling to risk his popularity, "he considered that he could not do anything less than express a desire for mercy" (II., 103). If Pitt denounces Parliamentary corruption, it is because "an improvement in this matter would, he hoped, increase his own power" (III., 127). If he is ill, as he constantly was—"suppressed gout," said Sir Andrew Clark once, "disordered the whole nervous system, and drove him into a state of mental depression varying with excitement and equivalent to insanity"—his gout, in Dr. von Ruville's judgment, becomes "an excellent excuse" for shirking some duty or concealing some opinion. If he refrains from advocating the overthrow of "the mercantile colonial policy," it is for fear of alienating his commercial friends (III., 161). If he "feigned pessimism," it is for fear of offending the King (III., 124). "In this, as in all cases," Dr. von Ruville sweepingly assures us, "his objects were eminently practical and selfish. He supported everything that could help his plans and opposed all that thwarted them"; though Dr. von Ruville is good enough to add that, wherever he can find an "excuse" for Pitt's actions, he does not fail to present it. It is indeed these excuses that we find it hardest to forgive. Dr. von Ruville may not have the faculty of understanding Pitt's motives, transparent as they often were. But the way in which he sets to work to suggest elaborately mean ones is the most perverse feature of a scholarly but wrong-headed book.

The worst instance of this occurs when Dr. von Ruville labors to persuade us that at two important periods of his career Pitt's political conduct was almost entirely dictated, first, by a desire to secure a large legacy from the old Duchess of Marlborough, and secondly, by a determination to make certain, whatever suppression of principle and opinion it required, of a still larger inheritance from Sir William Pynsent. To read Dr. von Ruville's comments on these two incidents alone is enough to show the singular attitude in which he approaches his ambitious task. It is no wonder after this to find him unable to see in Chatham's great stand for American freedom, in the wise and daring statesmanship which might have saved America for England by recognizing frankly her right to govern herself, anything but the "credulity" and "weakness" of a man who was "badly informed," and " did not know his own mind." From first to last this same grave fault runs through these volumes. In spite of their industry and elaboration, it seems never to have dawned upon the writer that Chatham could not possibly have been the peddling and self-seeking intriguer he depicts, whose actions it is necessary to account for by suggesting trumpery little motives in the perfect spirit of a *valet de chambre*. No man of that calibre could possibly have laid so strange a spell upon his age. Faulty, unequal, broken in his health he was. Often, no doubt, he disappointed expectations. Sometimes, in his aloofness and his distrust of party government, he proved a source of weakness to the great causes which he served. But, unless all contemporary belief is an illusion, he was also one of those rare, commanding figures, touched with the passion of the prophet, the vision of the seer, who bring into the world they move in a quality that common men do not possess, and whose lives lift the dignity of history above the littleness of which this book is full.

CURRENT FICTION.

The Adventurer, By Lloyd Osbourne. New York: D. Appleton & Co.

Mr. Osbourne's new story is characteristically ingenious and fantastic. The centre of the stage is held by a wonderful land-going ship, the Fortuna, constructed for the purpose of treasure-hunting beyond the South American llaños. Supported on eight gigantic wheels, and carrying two lofty schooner-rigged masts, she drives, day after day, across the trackless plain, bounding, jolting, careening before the trade-wind—her goal a deserted city of unknown antiquity, where ingots of gold lie stacked in subterranean caverns. The voyage of the Fortuna is full of vicissitudes. There is mutiny among her crew; there are hurricanes and calms, and accidents to gear and canvas; worst of all, there are hordes of screaming, half-naked savages, from whom the good ship escapes only after deadly battle. The final success of the enterprise is due, in large measure, to Kirkpatrick, the resourceful young captain. At the opening of the story he appears as an unsuccessful jack-of-all-trades, looking for employment in London. Pertinaciously following up the clue of a mysterious newspaper advertisement, he is led into the midst of an adventure, the objective of which is completely hidden from him, until he finds himself under the very masts of the Fortuna, in the far interior of the Orinoco country. An entertaining and varied group of persons embark upon this expedition with him, among them a German archæologist, a wealthy dowager from Paris, a manufacturer from Jersey City and his plucky daughter, Vera, between whom and Kirkpatrick develops an engaging romance.

Mr. Osbourne's versatile imagination

seems never to fail him. There is not a lull in the action, not a paragraph of dull writing. It is to be regretted that, in a tale so extravagantly fanciful, the author should have given himself free rein in the description of sickening carnage and violence. In spite of this defect of taste, and the too liberal amplification of a plot which is, at best, only a conceit, "The Adventurer" bids fair to take its place among a not too numerous company of Stocktonian and Stevensonian kindred.

The Golden Horseshoe. By Robert Aitken. New York: The John McBride Co.

Here are adventures with several vengeances. They carry the reader to that zone of South American revolution that is so dear, so useful to story-teller and playwright. Several fine young fellows, who, from being in debt or in love, set out to win money or to forget ladies, find themselves committed to the task of fighting a President in order to rescue the damsel beloved by two of them from the President's clutches. She being rich and his half-cousin, whatever that may be, is necessary to his plans, and has been kidnapped by him. He little knows that when she is smuggled out of New York, accident and design combine to furnish her on the high seas with a confidante, a secretary, and a devoted band of knights. Coincidence is the patron saint of this tale, and lavishly reunites in the most hidden places old college friends, old army associates, old lovers, old rivals. All work together for the great rescue, and find themselves swept, *nolens volens*, into the political war of the moment. Everything ends as it should, with cuffs and kisses falling respectively on the unjust and the just. The predicaments are magnificently many and ingenious, full of novelty to even the well-inured reader. They embrace drugging, kidnapping, destruction by torpedo, escape from shipwreck by feats of swimming that would put a duck to the blush; binding with ropes, exchanging of clothing, descent into mines of Spanish treasure where underground lakes and mummies do abound; siege and stratagem, oubliettes and earthquakes, and the confusion of armies by a phial of picric dropped from a balloon in which the lady is escaping, while the villain is lashed under the car to be wafted humanely to earth in a parachute.

All is told in a good narrative style, set off with conversations carried on in the lively modern tongues of the studio, the college, the army, the newspaper office. In fine, there is everything in the book to recommend it as a fantasy in exploit. It may be added that it makes appeal mainly to the reader who likes that kind of thing and likes a good deal of it.

Her Son. By Horace A. Vachell. New York. Dodd, Mead & Co.

This is a novel with a really novel situation in fiction, though, Mr. Vachell assures us, not in fact. In his note to the present (American) edition, he takes exception to the slurs which certain English critics, "notably the more youthful, to whom sentiment is as henbane," have cast upon the credibility of this situation. It is, he says, a true story; he has even heard of another similar instance since recording it, of "a second case of a young lady adopting a child, and presenting it to the world as her own." There is, however, no denying that the thing remains improbable in spite of the fact that it has happened more than once. It belongs to the order of melodramatic incident which only real life dares invent. It is so simple and natural a thing that it would not occur as possible to one in ten thousand members of that complex and unnatural machine—society. A young woman discovers that her affianced has left a mistress for her. There are palliating considerations, but she sends him away for a year. The mistress gives birth to a child, places it in a French foundling asylum, and returns to her career of actress. The man is reported dead in South Africa, and the fiancée, out of love for him, legally adopts the child. She does not deny the inevitable report that it is her own, is turned off by her family, and lives in retirement as a widow. The man returns to life, finds that his betrothed has been married and widowed in his absence, and promptly marries the actress. He knows nothing about the child, a boy, who grows up, and on the verge of manhood hears the current gossip about his mother. She lets him think himself her illegitimate son, Britannically fearing the effect upon him of the discovery that base blood is in his veins. Eventually, of course, he learns the truth, bears up under it as the son of his father should, and the death of the actress-mother makes matters smooth for a comfortable finale. No doubt the action turns upon sentiment; but, as readers of "The Hill" will recall, Mr. Vachell's sentiment is not of the watery kind. It consorts very well with sensible thinking and a plain and sturdy way of speech.

The Revelations of Inspector Morgan. By Oswald Crawfurd. New York. Dodd, Mead & Co.

As a matter of bald fact, the vast majority of criminals who are caught at all, are caught by the duly constituted officers of the law. Mr. Crawfurd is not the first author to realize that the private detective's inordinate proportion of successes in fiction makes our whole literature of "thrill" misleading. In his preface, he has stated his thesis with uncommon directness:

> This collection of stories is an attempt to establish the professional detective police of my own country in that position of superiority to the mere amateur and outsider from which he has been ousted in contemporary fiction.

The author's "own country" is England. He explains gracefully, in the present American edition of tales which have been popular in England, that what he has alleged of the British detective, he also alleges "on good authority of the American detective." Though this is a book of 341 pages, there are but four stories. Yet Mr. Crawfurd was apparently unable even in this small number of stories to confine himself to those strictly official achievements which his book was avowedly written to celebrate. In one tale, Inspector Morgan solves a mystery by means of clues which came into his hands at an earlier period when he was in the army. Another describes an adventure which occurred before he joined the force. Not only is the mystery here solved by Morgan, when a mere journalist, but the most brilliant deductions of that quest are made by an elderly archæologist, a personage still farther removed from Scotland Yard influences. Thus in more than a third of this book, the hero himself appears as an "amateur" detective, like Dupin and Sherlock Holmes.

This, of course, is nothing against the quality of the tales as tales. Readers will find two of the four stories well up to recent standards of the kind; while one, "The Kidnapped Children," works out a motive which is as adequate and convincing as it is ingenious and unexpected, not a frequent combination of qualities in a field of fiction so thoroughly worked over.

A Horse's Tale. By Mark Twain; illustrated by Lucius Hitchcock. New York: Harper & Brothers.

This is a short story—a good magazine story—transformed, by means of large type, double leading, wide margins, and thick paper, into a thin book. It is not primarily humorous, though of course there are touches of humor. The protagonists are an attractive little girl and her horse. The action begins briskly and cheerfully at a military post in the Far West, with soldiers, Indians, and Buffalo Bill for supernumeraries, and ends pathetically at a bull-fight in Spain. The Tale will interest both children and grown-ups.

BOOKS FOR CHILDREN.—II.*

We are introduced to science through an intermediate volume which indirectly bears upon the subject, for there is a science underlying play activity. Several years ago, E. V. Lucas edited a book entitled "What Shall We Do Now?" A new volume with the same title, written by Dorothy Canfield and others, comes from the Stokes press. There is abundant fun in its pages, well grouped, as shown by the headings "Games for a Party," "Rainy-day Games," and the like. It would seem that this is a more practical volume than the one issued by Caroline Wells—"Rainy Day Diversions" (Moffat, Yard), which offers too much mental exercise, and too little actual entertainment. We live in an electrical age; children are brought up on the word "automobile" before they learn how to spell "cat." Therefore, Tudor Jenks, in his "Electricity for Young People" (Stokes), is not only abreast of the times, but is also making a direct appeal to the modern boy. His volume tells in concise and simple language the progress of electricity, showing its discovery and its practical uses. A commendable feature is the combination of biography with scientific accomplishment. The book will please any young electrician from ten years up. Mr. Jenks is said to be writing a companion volume on photography. Considering the fact that we have from him another book, entitled "When America Was New" (Crowell), we marvel at his productivity. In this latter volume history for children is regarded from the social aspect; they are made acquainted with the economic conditions of the times. Another practical guide is Harper's "Electricity Book for Boys," written and illustrated by Joseph H. Adams. This is avowedly a book of instruction dealing with

*The first article was printed November 28.

those principles which are useful to the boy when making motors, putting up electric bells, and the like. In addition, electric light, heat, power, and attraction are explained by Joseph B. Baker, technical editor of the United States Geological Survey. In an appendix, electrical terms and phrases are defined. The book is not so historical as Mr. Jenks's; on the other hand, it is more practical. Another volume of a scientific character is "The Boys' Book of Locomotives" (McClure), in which J. R. Howden traces the evolution of the steam engine from its beginning to its replacement by the electric locomotive. There is much romance in this development, and the book will tempt old as well as young. With much the same purpose, Charles R. Gibson has discussed "The Romance of Modern Photography"—issued in a thick volume through Lippincott's. There is no attempt to offer suggestions to the picture-taker, but again step by step the growth of the art is discussed through the changes, from daguerrotypes to the latest improved methods; and from the toy known as the zoetrope—with which children used to amuse themselves—to the latest moving picture.

A companion volume in form is Richard Stead's "Adventures on High Mountains" (Lippincott), an out and out volume of incident and thrilling perils. The illustrations alone are sufficiently attractive to induce one to run through the 328 pages. A third volume, evidently belonging to the same series, and entitled "Adventures in the Great Forests," is from the pen of H. W. G. Hyrst. In his preface he asserts that the golden age of modern exploration as regards forests, lay between 1760 and 1860; that no longer do wild animals and savages haunt the by-paths of traffic. To judge by the illustrations, the modern reader will be rather glad that the Golden Age is past, although he will find plenty of entertainment in the account of startling exploits in the jungle. No less ferocious, when brought into unwilling relations with civilization, are the "Wild Animal Celebrities," whose biographies are included in Ellen Velvin's interesting little book (Moffatt, Yard). It is something for children to see the caged animals in our zoölogical parks. It is a still greater privilege, therefore, for them to know something of the personal lives of these beasts; and the author has sketched for us the events befalling the lions bears, and elephants, from their wild days to the time of their captivity; and besides that, she has given us good insight into the dangers encountered by the men who are responsible for the animals on exhibition.

In the biography of the year, we note Frederick A. Ober's continuation of the series entitled Heroes of American History. He has adopted his usual picturesque style, in his "Amerigo Vespucci" (Harper), and in his "Magellan."

In fiction many familiar names appear, but it is impossible in a short space to do credit to them all. Ralph Henry Barbour is the author of "Four Afloat" (Appleton), "Tom, Dick, and Harriet" (Century), and "The Spirit of the School" (Appleton). Mr. Barbour's spirit is always healthy, even though his plots may be lacking in originality. All of his stories deal with athletics, but they do not rise above the general level of the modern school tale. Everett T. Tomlinson's "The Camp-fire of Mad Anthony" (Houghton, Mifflin & Co.) tells of a tea party which took place in Philadelphia, and involved the heroes of this story; he also relates the adventures of the Pennsylvania troops under Anthony Wayne, from 1774 to 1776. In his customary manner, Mr. Tomlinson bases his incident upon fact. In this respect he is a seasoned writer, but he falls short in the development of his plot, and his style is not irreproachable. "Captain June" (Century) is a short story by Alice Hegan Rice, told with a certain freshness, although the situation is slight. The hero is a little boy, who is left with a Japanese servant, while his mother goes to join his sick father. He sees many curious Japanese customs, and becomes the centre of a little mystery. Mrs. Rice has done better work. It is easy enough to infer what kind of story Richmond Pearson Hobson would write for boys. His "Buck Jones at Annapolis" (Appleton) is sufficiently literal in title to mark it. This literalness is likewise to be found in Mr. Tomlinson's "Four Boys in the Land of Cotton" (Lothrop, Lee & Shepard), one of a series entitled Our Own Land. It is sufficient to note that the story is a vehicle only. For girls you have to choose between George Madden Martin's "Abbie Ann" (Century), Nina Rhoades's "Marion's Vacation" (Lothrop), "Priscilla of the Doll Shop" (Lothrop) by the same author, and "Peggy, Betsey, and Mary Ann," by Bell Elliott Palmer (Appleton). This represents a gay assemblage of feminine names. The parent who buys fiction for children without examining the books should be subject to a fine; he will discover nothing to pervert, but assuredly she will find little to stimulate.

For small children we note several distinctive books: a reissue of Virginia Gerson's quaint record of "The Happy Heart Family" (Duffield), which we praised in its first edition; Emilie Poulsson's "Father and Baby Plays" (Century), in which many suggestions are recorded, which serve to bring the child and the father closer together at playtime. Then there is Abbie Farwell Brown's "Friends and Cousins" (Houghton), a sequel to "Brothers and Sisters" of last year. The story is superior in style and plot to its predecessor, and will probably amuse young readers. By far the most delightfully spirited story for young folks is Mrs. Frances Hodgson Burnett's "The Cozy Lion" (Century), in which the most ferocious beast is pacified, just in time to enter amicably into gentle sport with a group of children.

Among the large books in which text is subservient to picture may be mentioned a white and gold bound volume entitled "Childhood" (Duffield), with imaginative and sympathetic pictures by Millicent Sowerby, accompanied by verses by Githa Sowerby. Helen Hay Whitney's "The Bedtime Book" (Duffield) consists of poems after the manner (moderately successful) of Stevenson, and illustrated in her customary decorative style by Jessie Wilcox Smith. This volume is uniform with Mrs. Whitney's previous book. In this same paragraph may be included Lady Tennant's "The Children and the Pictures" (Macmillan). Paintings by famous artists are reproduced, many of them in rich coloring; and the text is a fanciful sketch, in which the figures in the pictures descend from their frames and talk to the little heroine about events of long ago. Among the thousands who enjoyed Miss Maude Adams's performance of "Peter Pan," none could have been more enthusiastic than Oliver Herford, who in his "Peter Pan Alphabet" (Scribner) pays tribute to every little incident in the play, whether it be "K stands for Kiss," "N stands for Nana," or "A for Adams."

We beseech the mothers and fathers who read these columns to give the subject of book-buying some forethought and to visit the public libraries, which are placing on exhibit the latest children's books.

Wordsworth and His Circle. By D. W. Rannie. New York: G. P. Putnam's Sons. $3.50 net.

With Wordsworth in England. Selected and arranged by Anna Benneson McMahan. Chicago: A. C. McClurg & Co. $1.40 net.

Wordsworth's Poems. Selected by Stopford A. Brooke. New York: McClure, Phillips & Co. $3 net.

There are faults in Mr. Rannie's "Wordsworth and His Circle" which it would be wrong to pass over. Though well-read and in the main judicious, he occasionally makes odd slips in his critical remarks. It shows, for example, a curious sense of language to say that the Bucolics of Virgil are "expressed in the *ipissima verba* of simple folk." It indicates also a somewhat vague knowledge of Continental literature to identify, as Mr. Rannie apparently does, the *Aufklärung* and romanticism; and this error is in a way serious as it illustrates the loose ideas still prevalent in English books on the relation between the romantic movements in England and in Germany. To come nearer home, how many people will agree with Mr. Rannie that "The Idiot Boy" is "really as humorous as 'John Gilpin' "? The present reviewer for one cannot remember ever to have laughed enormously over the adventures of Betty Foy, nor, in general, has he found humor a main inspiration of the first "Lyrical Ballads" and of "Peter Bell." Again, it is not proper for a critic to quote Southey's lines:

> Not to the grave, not to the grave, my soul,
> Follow thy friend beloved,
> The spirit is not there—

and to say they are "as good as Longfellow at his best."

But Mr. Rannie's critical shortcomings lie deeper than these perhaps excusable faults of detail. "It is best," he says, "to take Wordsworth as he took himself, quite seriously"—he might have added, as indeed he does in spirit, *and reverently.* But it is possible to deal with Wordsworth in entire respect, and yet to see that his philosophy of life is, on one side, essentially unsound. Consider that perfectly worded and most characteristic stanza:

> One impulse from a vernal wood
> May teach you more of man,
> Of moral evil and of good,
> Than all the sages can.

Mr. Rannie quotes this stanza and has no word of protest against its meaning, yet really, so far as it has any meaning, it is

not only nonsense—why not say the truth? —hut pernicious nonsense. One is tempted to compare the lines with Wordsworth's bugbear, Pope:

> First follow Nature, and your judgment frame
> By her just standard, which is still the same;
> Unerring Nature, still divinely bright,
> One clear, unchanged, and universal light . . .
> Those rules of old, discover'd, not devised,
> Are Nature still, but Nature methodized . . .
> Be Homer's works your study and delight,
> Read them by day, and meditate by night . . .
> Learn hence for ancient rules a just esteem;
> To copy Nature is to copy them.

The attitude of Pope toward nature is one-sided and, even thus, far enough from his own practice, but at least this conception of the lessons of nature as embodied once for all in precepts and examples is wholesomer and truer than a romanticism which professes to learn more of man and morality from trees than from Christ and Plato. Now Mr. Rannie is by no means hlind to Wordsworth's lapses into dulness and triviality; he even insists on these points too frequently, thinking thereby, no doubt, to save his critical discernment; but it is time that all of us, while recognizing the loftiness of Wordsworth's genius and accepting gratefully the consolation of his pantheistic revery, should acknowledge also that in so far as he attempts to satisfy the heart of man through inanimate nature he is on an essentially lower level of poetical philosophy than the old way, which went immediately to the thrust of human passions and the battle of man with man. It is this, and not his occasional nodding that will forever bar him from the company of the supreme poets.

But we have already done Mr. Rannie's book an injustice by insisting so heavily on these points. As a matter of fact, his faults are few and easily relieved from their context; the merits of his work are pervasive and not readily specified. Even in matters critical he is commonly sound and ingenious, and his chapter on Southey may be named particularly as an admirably just and interesting attempt to show the real value of that neglected poet, without losing sight for a moment of his limitations. Even hetter is Mr. Rannie's treatment of the lives of Wordsworth and his friends. Criticism, quotation, narrative, and anecdote are so woven together as to form a single piece, and Mr. Rannie has shown unusual skill in the difficult task of associating a number of persons together so as to make them seem really a group of living friends. Coleridge moves through the scenes, with the divine light ever waning in his eyes; Lamb banters and praises; Southey, Christopher North, Dr. Arnold, De Quincey, Scott, Rogers, Keats, come and go, speak and listen, and range themselves in proper perspective about the central, still lonely figure. The style is always graceful and dignified, and we do not hesitate to affirm that this is the best book yet written for any one who wishes to hreathe, so to speak, the very atmosphere in which these men moved.

Of the two other hooks named at the head of this review, a word is sufficient. Mrs. McMahan has hrought together the poems of Wordsworth with a few letters that illustrate his life in England, and has added a large numher of photographic illustrations which help to make more real the places described or alluded to. The volume is thus an excellent supplement to Mr. Rannie's (which is illustrated less freely), although her own introductions and comments are of no special value. Something of the same nature is the volume of selections edited hy Stopford A. Brooke. The illustrations here are from pencil drawings made by Edmund H. New, more artistic and agreeable to the eye than the glazed photographic reproductions, but sometimes a little vague in the impression they leave.

Il Tragico Quotidiano. By Giovanni Papini. Florence: Lumachi.

According to its foremost British exponent, pragmatism includes not only the will to believe, hut to disbelieve, and to make believe. Utilizing this formula of Schiller, the first function has been seen in Professor James's well known work, the second in Papini's "Crepuscolo dei Filosofi" (1905), while the third is manifest in the latest effusion of this young Italian thinker. Here he has been likened to a Heinrich Heine who has taken lessons from Ibsen. Having emerged from that twilight of philosophers wherein he has disposed of Kant with his arid noumenalism, Hegel with his rigid doctrine of becoming, Schopenhauer with his illusory pessimism, Comte with his presumptuous positivism, Spencer with his mechanical evolution, and Nietzsche with his neurasthenic apotheosis of power, the Florentine iconoclast now essays to substitute his own ways of thinking in what he describes as a series of obscure fables and disquieting colloquies. In one of his defensive prefaces written, much in the manner of Bernard Shaw, to anticipate hostile criticism, Papini explains to his philosophic readers that his rule of thinking is to render habitual those actions and sensations which are extraordinary, by putting aside those that are ordinary and unexceptional. The daily tragedy, he abruptly exclaims, is that we are forced to behold a banal world in which the majority of men live in a state of bovine indifference, and in which matters of interest diminish every hour. But there is a remedy for this: it is to hehold the common world in an uncommon way, to think what no one else thinks, to be astonished at what no one else regards. The first step towards this new world of wonder is forgetfulness, for oblivion of the external achievements of others will lead to astonishment at the strange thoughts which arise within one's self. In a word, the new imperative is this: Learn to see the world in thyself!

Here is a pragmatism in an extreme and peculiar form, skepticism brought into a strange conjunction with radical empiricism, the ancient sophism expressed in current terms, a mixture of an individualist's revolt against settled systems of thought and the ennui of a "cerehralist," exasperated over the dead level of modern democracy. But there is more to the matter than this negative attitude. Scorning the fancies of metaphysicians, the pragmatist still attempts to erect some positive scheme of his own. Adopting the Protagorean dictum, "Man is the measure of all things," he turns it into a transcendental doctrine of hecoming: Man is the medium of the cosmic consciousness. So in this radical exponent of pragmatism extremes have met; skepticism has ended in mysticism, as is shown by the steps he would take to achieve his ends. As with the mystics, the purgative stage precedes the illuminative, so with him forgetfulness brings awe. Oblivious of the ordinary waking life, he exclaims, Let us seek in our unconfined and uncontrolled thoughts that which is mysterious, enigmatical, terrible; for otherwise, imprisoned in this house of facts, we shall never reach the mystic cell of the imagination, where alone life is profound:

> Tired of others, with their utterly trivial interests, tired of myself, as I am, let me commence a new chapter in the story of the universe.

Meanwhile, hefore the first instalment of this autohiography of the cosmos, he has different work to do. While urging his followers to he other Alexanders with other worlds to conquer, he himself must put to flight the enemies of pragmatism. These are the formal philosophers, who strive after the ultimate essence of things. They may be ghostly foes, but they are dangerous. So many Hamlets, they have been walking in a world of shadows; pure rationalists, they have heen under the despotism of a symhol, have reduced the infinite variety of nature to some single insubstantial phrase, in brief, attempting to create, they have actually destroyed, and their motto should not be *fiat,* but *pereat.* So a new creator is needed; he is the pragmatic Man-God who hy the power of his imagination is ahle to body forth the contents of his will. If another is able, as it were, to create me by dreaming through the years of my life in as many moments of his sleep, consider what it would mean to utilize to their full extent the powers which we have within ourselves, to become lords of this earth hy realizing our wishes and our dreams!

With this rhapsody Papini concludes a volume which it is evident will not add much to his reputation as a thinker. Nevertheless, out of this medley of enigmatic fahles there is to he extracted a little metaphysical meaning; that meaning is that the world is, in a measure, plastic, and that the environment may, in some degree, be adapted by man to his own liking. As a theory of reality that doctrine may be invalid; as a practical rule of living, it has a certain interest. If the Italian delighted less in symbols, if his promised work on pragmatism proper were to be written with the clarity and ease which mark his recently translated brochure, in the Octoher numher of the *Popular Science Monthly,* he might gain a hearing among us. Pragmatism is in the air, for not only are the women reading it, the clergy preaching it. It may be a loose way of thinking, but it is hetter than no thinking at all, and, for the first time since the days of Emerson, it promises to he a popular philosophy. Here two things are in its favor: with its insistence on the latent powers of man it has its affiliations with the so-called New Thought; with its ability to blink the disagreeahle facts of life it is akin to the current demand for an optimistic idealism.

Science.

The Chemistry of Commerce: A Simple Interpretation of Some New Chemistry in its Relation to Modern Industry. By Robert Kennedy Duncan. New York: Harper & Bros. $2.

This book has the rare qualification of being needed, for nowhere else can the average reader find recent discoveries and manufacturing processes so clearly and accurately explained. Prof. Duncan is a good interpreter of his science, because he understands what points are of interest to the public, and he can present them without either blinding the reader with unfamiliar terminology or indulging in a fairy-tale phraseology.

The revolution that has taken place in chemistry chiefly during the past decade is essentially a change from the analytic to the synthetic. The science has become creative; instead of following nature, it leads. In the first part of its recent development it was merely imitative, and in this way became associated in the popular mind with innumerable forms of sophistication and adulteration. To-day, instead of manufacturing dyes like those obtained from plants, perfumes that can not be distinguished from the genuine, accurate imitations of gems, and artificial drugs, it is producing thousands of new colors, perfumes and flavors never found in fruit and flowers, precious stones unknown to the mineralogists, and the medicines contrived to meet the specific requirements of the physician. Man is, therefore, being relieved in part from his dependence upon the chance occurrence and discovery of a useful ingredient in some rare tropical plant. The modern industrial chemist proceeds like an architect in building a house, or an engineer in constructing a bridge. If he wants a coloring matter of a certain shade, durability, and intensity, or an antifebrile drug, he does not make fluid extract of the herbarium specimens from Brazil or Sumatra, but he takes out his pencil and draws a sketch of the molecule having the special properties that he desires; then he goes into his laboratory and constructs it. Posterity is in no danger of being starved out, because the bacteria which work in the nodules of the roots of peas and beans do not succeed in capturing enough of the elusive nitrogen of the air to keep up food supply. Man now can produce his own assimilated nitrogen as a fertilizer for the soil by miniature lightning flashes through the air.

Prof. Duncan has a new method of bringing the factory and the university closer together by the establishment of industrial scholarships in educational institutions, the holder to devote his time and research appliances of the laboratory to the working out of some special problems of the manufacturer who pays his expenses. This system, which has been established in the State University of Kansas, he describes in the closing chapter.

Moffat, Yard & Co. announce the publication, in March, of "Religion and Health; the Moral Control of Nervous Disorders," the first official book growing out of the much discussed Emmanuel Church movement in Boston. The authors are Elwood Worcester, D.D., director of Emmanuel Church Class for Nervous Disorders, formerly professor of philosophy and psychology at Lehigh University; Samuel McComb, D.D., associate director of Emmanuel Church Class for Nervous Disorders, formerly professor of church history at Queen's University, Canada; and Isador H. Coriat, M.D., second assistant physician for diseases of the nervous system at the Boston City Hospital, formerly first assistant physician at the Worcester Insane Hospital.

Many families will welcome a good book on the plan of the "Standard Family Physician" (Funk & Wagnalls Co.), whose two volumes of nearly eleven hundred pages are declared by a sub-title to be "a practical international encyclopædia of medicine and hygiene, especially prepared for the household." The editors are Prof. Carl Reissig of Hamburg and Prof. S. E. Jelliffe of New York, with a long list of associate editors, of whom thirty-three are attributed to Germany and ten to America. Taken as a whole, the work is a commendable effort to lead the layman to take a rational view of diseases and of "the results which may be reasonably expected from therapeutic measures." The opposition to quackery in its various forms, to all the "pathies," and to "natural" methods is praiseworthy and ought to do good. On the other hand, it is to be feared that many laymen, already far too eager to venture into the unknown, may be tempted by the great variety of information to embark on the sea of therapy with quite too brief sailing directions, and no compass. The anatomical and physiological details in the introduction are far too meagre for the average reader, who needs more help and deserves more correct and illuminating pictures. The other illustrations are, in the main, good, but sometimes quite superfluous. Space forbids any detailed notice of the individual articles, which are uneven in quality, beyond commending those on burns, dress, care of the baby, nourishment of the sick, and pain, as examples of a good method, and noting, as illustrative of poor treatment, bread, dwelling places, imbecility, and school. In general, it may be said that too little attention is paid to the emergencies of domestic life, the very conditions where such a book is most needed in families at a distance from medical aid. The list of drugs and doses is too extended and tempting.

It's a far cry from the brief article of Eienstock in 1884 to the recent book of C. A. Herter, "The Common Bacterial Infections of the Digestive Tract and the Intoxications Arising from Them" (the Macmillan Co.). Those to whom the terminology of the bacteriologist is not unfamiliar will find here not only a well written but also an interesting and suggestive study of a rich fauna and a discussion of questions of much import, for they are fundamental in relation to a great human woe, indigestion. Particularly alluring is the antagonism existing between different bacteria, the opposition of the native to the immigrant forms. Dr. Herter is cautious in his statements as to the harmfulness of the various forms and the prospect of remedial measures. His allusion to the varying susceptibility of the nervous system to toxic influences seems to us almost too reserved.

From John Wiley & Sons comes Benjamin R. Tillson's "The Complete Automobile Instructor," a handy little volume of interest and value to the professional motor-car driver as well as to the amateur and to the salesman. Arranged in the form of question and answer, it states lucidly and clearly the principle, the operation, and the care of gasolene automobiles. Herein are set forth the mysteries of the magneto, clutch, ignition, timers, coils, and all the other parts of the complicated automobile of to-day, not only by means of clear and simple language, but through many valuable illustrations. Of the crop of automobile instruction books that have appeared in the last two or three years this seems to us the one the automobile owner who knows little of mechanics will find it easiest to master. Many readers, however, would have liked it better if after each of the more than six hundred questions had been placed the answer, instead of separating all of the questions and answers as Mr. Tillson has done. The book has an excellent index, and is handsomely printed.

Bulletin Number 31 of the Biological Survey at Washington, entitled "An Economic Study of Field Mice," by David E. Lantz, is a plan of battle against these little creatures; and the farmer who reads it has small excuse for not saving his young orchards, nursery stock, and grain. The average annual loss from the three species of field mice of the genus *Microtus* alone, amounts to $3,000,000, and this treatise aims to save a portion of this waste. The principal part of the bulletin is devoted to the damage done by the mice, each class of crop being considered in order, with illustrations showing what injuries are to be laid at the door of the field mice and what to rabbits and other rodents. The value of owls, most hawks, shrikes, snakes, skunks, badgers, and most species of weasels, as the natural enemies of field mice, is clearly demonstrated. Finally, we have concise directions as to the most efficient modes of trapping and poisoning. This is a type of the effective aid which the Biological Survey is affording to farmers.

"The Fungus-Growing Ants of North America" is the title of an elaborate paper just published by Prof. William M. Wheeler (Bulletin of the American Museum of Natural History, Vol. XXIII., Article 31). It is divided into four parts, namely, a résumé of the writings of previous students of these ants, a taxonomic revision of the known North American members of the group, an account of Professor Wheeler's own observations, and a consideration of the main problems involved in the study of the fungus-growing instincts not only in these ants, but also in certain termites and the ambrosia beetles. The fungus-growing, or parasol, ants are of great interest both on account of their unusual and complex instincts and in their relation to man; for they are one of the scourges of the tropics. They strip plants of their foliage, and, carrying the leaves into their nests, masticate them, and plant the residue in a specially prepared garden; a species of fungus soon appears in abundance. The larger workers cut and gather the leaves, those of medium size do the chewing, and the smallest ants in the colony destroy the spores of all other fungi but the edible, and prune that. This latter

work is most important, for, as was proved by experiment, if the fungus once gets the upper hand and begins to branch, the ants are fairly driven from their home by their own bread-fruit trees. The paper forms an important contribution to entomology, and is filled with new and surprising facts. As to the origin of the fungus-growing and eating habit, which, by the way, has arisen independently in beetles, termites, and ants, there have been several theories advanced. The most probable is that of Von Ihering, who thinks that the insects in former times fed only upon grain. Some of this, if carried unripe into the nest, would become mouldy, and the ants, feeding upon it, would eat portions of the fungus. In time they might come to prefer the latter to their more usual diet. Be that as it may, these insects "in the fierce struggle for existence, everywhere apparent in the tropics, have developed a complex of instinctive activities which enables them to draw upon an ever-present, inexhaustible food supply through utilizing the foliage of plants as a substratum for the cultivation of edible fungi. No wonder, therefore, that, having emancipated themselves from the precarious dict of other ants, which subsist on insects, the sweet exudations of plants, and the excrement of phytophthorous Rhynchota, the Attii have become the dominant invertebrates of tropical America."

The August number (Vol. II., No. 4) of the medical section of the *Philippine Journal of Science* has, among its four papers, one by Lieut. C. L. Cole, an army surgeon, relating the discovery of *Necator americanus* (the "hookworm," the parasite which produces the peculiar anemia of Porto Rico) in the dejecta of many members of the Philippine Scouts organization sent to the hospital for other diseases. Facts are presented to show a considerable prevalence of this disease in the Pbilippines, where it had not been hitherto reported, or at least had received no particular attention. A paper in the same number treats of infant mortality, a problem serious everywhere, but extraordinarily so in Manila. During the four years, 1903-1906, an average of 4,700 infants under one year of age died annually in that city, these deaths constituting almost 50 per cent. of the total mortality. It is stated in this paper as a very conservative estimate that 2,500 of these infants died every year simply for want of sufficient or proper food.

Bernard James Harrington, professor of chemistry in McGill University, died in Montreal, November 29. He was born in 1848 at St. Andrews, Province of Quebec, and he studied at McGill and Yale. After some service in the Geological Survey, he was appointed in 1883 to a professorship at McGill. For many years he was editor of the *Canadian Nationalist;* and he was author of many monographs on the mineralogy of Canada, and of "The Life of Sir William Logan, First Director of the Geological Survey of Canada," 1883. He was a member of many learned societies.

Dr. George F. Shrady died in this city November 30. He was born here in 1837, and after graduation from the College of Physicians and Surgeons, in 1858, he began the practice of medicine. He attained prominence when he was called to attend ex-President Grant during his last illness. He served as a surgeon in many of the New York hospitals; he had been president of the New York Patbological Society, of the Practitioners' Society of New York, and of the American Medical Editors' Association; and he was a member of various scientific and professional organizations. From 1860 to 1864 he edited the *Amcrican Medical Times.* In 1866 he founded the *Medical Record,* whicb he edited till 1904; and he was tbe author of "Pine Ridge Papers" and many articles on surgery.

James Herbert Veitch died at Exeter, England, on November 13. Born in 1868, in due course be became a member of the firm of nurserymen and seedsmen, James Veitch & Sons, Chelsea. In 1891 he started on a tour through India, the Straits Settlements, Japan, Korea, Australia, and New Zealand, to study the vegetation of those countries, with a view to introducing new species into England. He contributed his observations in a series of letters to the *Gardeners' Chronicle,* afterward reprinted under the title "A Traveller's Notes." Later, as manager of his firm, he sent E. H. Wilson to collect new species of plants in western China and Tibet. Last year he published "Hortus Veitchii," an elaborate work describing all the exotic plants and the hybrids the firm has cultivated.

Drama.

Plays of Our Forefathers, and Some of the Traditions Upon Which They Were Founded. By Charles Mills Gayley. New York: Duffield & Co. $3.50 net.

It was a fortunate idea of Professor Gayley's to attempt an account of the English miracle plays with reference not only to their importance as an instance of the development of literary art, but, to use his own words, "as a chronicle of the ideals and traditions, the religious consciousness, the romance and humor of times that seem to be remote, but after all are modern in a myriad surprising ways." The result is a charming book, which may be recommended to the general reader as the best introduction to the subject at the same time that it possesses a value for the specialist. We cannot always, we confess, follow Professor Gayley in his admiration for these earliest products of English dramatic genius. Especially in regard to scenes of comedy his own sense of humor sometimes leads him to read into the lines a comic force which, as a matter of fact, the old dramatists with their embryonic powers of expression were unable to attain. These gifts of humor and sympathy, however, stand the author in good stead in imparting interest to material which is often far removed from modern modes of thought and feeling. In this respect the work complements admirably the technical and detailed exposition in Chambers's "Mediæval Stage" of the development of the miracle plays from the more purely historical point of view. The quality of humor, however, is only one of the features of these plays which have an interest for modern readers. Very suggestive are the chapters devoted to the romantic element, which the author notes especially in the "Ludus Coventriæ" and the York plays of the Middle Period; and to the other elements of pathos and sublimity, which are more obvious, as well as more generally diffused through the cycles.

In the earlier chapters of his work, Professor Gayley gives more space to those singular festivals of the mediæval church which are so closely allied with the miracle plays, viz., the Feast of Fools, the Feast of the Ass, etc., than would have been likely before the appearance of Mr. Chambers's treatise. He exhibits an independent judgment, however, in these matters, as also throughout his account of the origin of the mediæval drama, its development from the trope to the full form of miracle. The most important part of the book for the special student, is, as it seems to us, that which deals with the relations of the plays of the different English cycles to each other. Considering the activity of mediæval studies during recent years, it is singular that more has not been done to clear up these relations. As is well known, the problem is complicated by the fact that each of the greater cycles, in the form in which they have come down to us, represents the growth of a considerable number of years, so that not only are the plays the products of different hands, but some of them have suffered alterations and interpolations. The observations on this subject in the present work will accordingly be read with great interest. After a brief chapter on the mysteries in France our author concludes this division of his book with a survey of the origin and history of the strange and famous traditions which figure so largely in the miracle plays, such as the legend of the Holy Rood-Tree, the Harrowing of Hell, the Coming of Anti-Christ. Professor Gayley has not discussed the remaining forms of the mediæval drama—namely, the morality (or "moral," as contemporaries generally called it), and the interlude—with anything like the fulness with which he has discussed the miracles. It is to be noted that, like Mr. Chambers, he emphasizes the fact that no sharp distinction was drawn between moralities and interludes.

We should not take leave of this volume without remarking on its handsome typography and the excellent illustrations, relating to nearly every aspect of the mediæval drama. It is a great pity, however, that the sources of these various illustrations have not been stated with the needful accuracy. When for instance, a picture of "Devils and Cauldron" (p. 178) is said to be taken from "Histoire de la langue et de la littérature française," it is not unreasonable if the reader should wish to know whose history this is, and in what volume and on what page the illustration is to be found. Indeed, the manuscript source, itself, ought to have been given. To have supplied this information would have cost the author, of course, practically no trouble.

Prof. Charlton Minor Lewis of Yale will soon issue, through Henry Holt & Co., "The Genesis of Hamlet," in which he attempts to solve the problem of Hamlet by discriminating "between Shakespeare's original contributions to the story, and the legendary materials that he inherited." Dr. Lewis's volume will also handle, among other topics, the "Theories of Coleridge and

Werder," "The First Quarto," "Kyd and Belleforest," "The German Hamlet," and "Ophelia."

A memorial edition (Mindeudgave) of Henrik Ibsen's Collected Works in five substantial quarto volumes has just been completed by the Gyldendalske Boghandel of Christiania and Copenhagen. Although printed on fairly good paper with a clear and legible type, this edition, which comprises all of Ibsen's published works, is sold at a very low price (about $4 in paper cover, $6 bound in cloth). Each volume has as a frontispiece a portrait of Ibsen. The editor is Prof. Johan Storm of Christiania University, who has appended a treatise on Ibsen's grammar and spelling. Professor Storm has succeeded in correcting many printer's and other errors, but he has also in a number of places taken upon himself to correct Ibsen's spelling or grammar. It seems, however, that the learned editor might better have confined himself to establishing what Ibsen really had written or intended; because it is Ibsen himself we want, with his greatness as well as with his faults, and this especially in a "memorial edition."

Signor Ermete Novelli began his second New York season in the Lyric Theatre on Monday evening, with a performance of "Othello," a character in which his artistic limitations are, perhaps, more sharply defined than in any other which he has attempted here. That his impersonation should fail to meet the requirements of the best English-speaking standards, or bear the test of comparison with the work of Edwin Booth, E. L. Davenport, and other earlier actors, is not remarkable. An adequate knowledge of Shakespeare's language is essential to a thorough comprehension of Othello, or of any of his principal creations. In the Italian version of the play the character of the Moor is discernible only in its cruder outlines. Not only this: the text itself is robbed of all its poetic beauty and much of its dramatic point. It is not strange, therefore, that in an Italian representation the play should degenerate into romantic melodrama. What is significant is that the deficiencies of Signor Novelli as an actor should be peculiarly apparent in what is manifestly a traditional Italian conception of the central part. In many details of its "business" his Othello is clearly modelled upon that of Salvini. He even imitates the action of the latter—which provoked so much criticism thirty years ago—in threatening to grind his heel into the face of the prostrate Iago. Other striking correspondences might be quoted. Yet in general spirit and effect the two impersonations are almost as far apart as the poles. About the Othello of Salvini, in spite of all its realism and barbaric rage, there were a native dignity and majestic power which in Signor Novelli's are almost wholly absent. The difference can be accounted for only by the higher intuition, as well as the superior skill, of the older actor.

William C. de Mille's new piece, "The Warrens of Virginia," which was produced in the Belasco Theatre on Tuesday evening, although differing in theme, belongs to the same category as "A Grand Army Man," with which David Belasco recently opened his other theatre. Dealing as it does with the simpler domestic emotions, it affords a welcome relief from the frenzied drama which Mr. de Mille affected during his Leslie Carter period. It is not of much consequence as a play, being altogether artificial and conventional in structure, and making its appeal by trite devices to sentimental impulses rather than to the intellect; but it is wholesome and fairly interesting entertainment, and contains several excellent theatrical situations, which would be still more effective if they were the result of a compelling dramatic force, and not of obvious machinery. The scene is laid in Virginia during the last days of the war, and the opening conditions and incidents are arranged, without much reference to probability, to bring about a climax which in itself is a strong and good one. A young Northern officer, in love with the daughter of the Southern General Warren—who is in desperate straits with his troops in the neighborhood of Appomattox—obtains leave to visit her, at her father's house, on condition that he will agree to be captured on the premises with a misleading dispatch in his possession, the object of which is to beguile into ambush a provision train upon which the last hope of the Confederate commander rests. The stratagem succeeds only too well, and the officer is placed in the position of one who has violated the laws of hospitality and abused the confidence of his betrothed to bring defeat and ruin to her hitherto invincible father. The story ends, five years later, with a pretty but feeble sentimental scene, symbolical of the era of forgetfulness and conciliation, in which the speedy reunion of the lovers is foreshadowed. The play is likely to be popular, but the manner of the representation is more notable than the subject matter. The general quality of the acting is good, especially in the case of Frank Keenan, the Confederate general; the scenery is thoroughly artistic, and the military and domestic details are reproduced with a realistic accuracy which Mr. Belasco himself has never surpassed.

The London theatrical and musical friends of Sir Charles Santley and Sir John Hare are preparing to celebrate their elevation to knighthood with a big feast. Everybody is agreed that Santley has earned whatever honor there may be in the somewhat vulgarized distinction which has been awarded to him. He is one of the most trustworthy and conscientious, as well as one of the greatest, singers whom Great Britain has produced in the last century. His work in opera, in oratorio, and on the concert stage has rarely been surpassed. The dramatic power of his delivery was almost as remarkable as the beauty of his voice. Sir John Hare has not been so prominently or so long before the public, but it is generally acknowledged that the artistic finish of his miniature work has justified his selection for special honor. It is nevertheless noted that his range has been narrow, and that his highest achievements have been in the interpretation of Robertson and Pinero. He has never been associated with any famous dramatic work or any great dramatic conception. Correspondents of the London press are asking why Beerbohm Tree is not also Sir. As an actor he has—it cannot be denied—explored much wider fields than Mr. Hare, and he has expended vast sums in spectacular representations of Shakespearean fragments. He has, at least, dared greatly, if not always wisely. Perhaps Mr. Hare has commended himself to the authorities by never attempting the impossible, never trying to exceed the safe limit of his capacities.

The death is announced in London of Henry Kemble, an English actor, who will be remembered by older playgoers in this country as a low comedian of uncommon merit. He was a member of the famous Kemble family, and personally resembled the portraits of Stephen Kemble as Falstaff. He was born in London in 1847, and was educated by his aunt, the beautiful and accomplished Fanny Kemble. He acted with Beerbohm Tree, Charles Wyndham, and others.

Music.

Ignaz Jan Paderewski. By Edward Algernon Baughan. New York: John Lane Co. $1.

This volume on Paderewski, by one of the most distinguished of the musical critics of London, is the latest issue in John Lane's Living Masters of Music Series. It appears opportunely at a time when the pianist's sixth American tour is once more arousing public interest in his art, his personality, and his career. On all these points Mr. Baughan has provided as much information, culled from diverse sources, as could be expected in the space assigned to him. He dwells on the fact that Paderewski began his musical career as a composer; at the early age of seven he wrote a set of Polish dances, and at sixteen he played his own pieces to Russian audiences. At that time his technique was so weak that, as he afterwards confessed, "All the pieces he played were really his own, inasmuch as when he could not manage the difficult passages he merely improvised." He studied two years at the Warsaw Conservatory, and was then appointed professor there. Five years later he became professor of music at Strassburg. It was at this time that he met Mme. Modjeska, who was the first to recognize his extraordinary gifts, and to encourage him to develop them.

In 1886 he went to Vienna and studied with Leschetitzky, who gave him the technical surety and brilliancy he chiefly needed. Leschetitzky already had a high reputation as a teacher, and the subsequent success of this pupil made it world-wide, so that "pupil of Leschetitzky" has now come to mean almost as much as "pupil of Liszt." It is not likely that Paderewski would ever have become a teacher had he failed as a virtuoso; for, as he once said:

> Any one who takes up piano playing with a view to becoming a professional pianist has taken on himself an awful burden. But better that than the drudgery of giving pianoforte lessons. The one is only purgatory, but the other—hell.

Liszt did not regard teaching in that light; he evidently took pleasure in it; but Paderewski, since his conservatory days, has had only a few pupils, among them Antoinette Szumowska and Ernest Schelling. That he should describe the life of a professional pianist—he who has all the world at his feet—as purgatory, will

surprise many; but they must bear in mind how much Liszt's *génie oblige* implies. Months before a famous pianist goes on a concert tour he has to practise daily for eight or ten hours, and he has to keep this up during the tour because of the stupendous technical difficulties of modern music. There are times, to cite Paderewski's own words, "when every movement of the hands is provocative of discomfort, if not actual pain." Often, after a performance, he adds, "I have had no little exhaustion of the shoulders and neck, and I have also suffered from severe neuralgic pains." Then there is the mental discomfort of nervousness from which great artists are never free. "The mere fact of knowing a great audience waits on your labors," he once said, "is enough to shake all your nerves to pieces."

His fame as a pianist began in Paris, was augmented in London, and reached its climax in the United States. In Germany he has not played often, although in Leipzig, as one critic wrote, "the public did not applaud, it raved." Mr. Baughan devotes a considerable number of pages to an attempt to describe the magic of Paderewski's art. He "possesses that curious magnetism which always enchains the attention of the public." He excels others in the art of "creating an atmosphere":

> No pianist so well understands how to produce beautiful tone; no pianist has such a variety of touch; and none such a grasp of the art of pedalling and phrasing. The Paderewski tone is a thing by itself.

Mr. Baughan does not overlook what he considers weak points in the Pole's armor; yet he has no difficulty in understanding why Paderewski has "the power of moving an audience as no pianist since Rubinstein has been able to move it."

To Paderewski, the composer, less attention is given than might have been wished, and no complete list of his works is appended. The nationalism of this Pole is considered in its relation to Chopin, and the curious fact is pointed out that there is also a strong vein of antique simplicity, as exemplified in the first minuet. Closely connected with this is the fact that Paderewski has taken special pleasure in rehabilitating Mendelssohn, whose "Songs Without Words" had been "made so dim by the clumsy handling of generations of schoolgirls." The author might have added that this pianist is now doing the same thing for the Chopin of the conservatory girls.

Richard Wagner, as a boy, wrote a good deal of poetry before it ever occurred to him to try his hand at composing music. That his poetic faculty matured before the musical is evident in his early operas, up to and including the "Flying Dutchman." Liszt did not exaggerate when he wrote that in the text of this opera every line "rises far above the opera texts heretofore known." It is a romantic story, poetically and dramatically told, with much fewer weak passages than there are in the music. Wagner was twenty-eight years old when he wrote this music, and there are not a few numbers which betray the influence of the fashionable Italian opera of that period. On the other hand, Senta's ballad is tuneful without betraying any such influence. What makes this early opera interesting to the Wagnerian devotee is the storm music, in which one scents the salt sea, and, still more, the power which Wagner already manifests of painting characters in music as well as in words. For this reason chiefly did the large audience which heard this opera at the Metropolitan (where it had not been sung for six years) on Monday applaud it. There was a strong cast, too, including Gadski, Van Rooy, Knote, Blass, and Dippel, and the setting was strikingly realistic—so far as marine realism is possible on the stage.

Very little chamber music is heard in our concert halls this season, and in view of the abundance of operatic and orchestral performances, which appeal to a larger class, this is perhaps not surprising. So far the only organizations heard have been the Margulies Trio two weeks ago, and the Kneisel Quartet on Tuesday night. The first concert of the Kneisels was unusually delayed because the resignation of Mr. Theodorowicz and Mr. Schroeder last spring made it necessary to engage a new second violinist and a new violoncellist. Mr. Kneisel was lucky in securing in their place Julius Roentgen and Willem Willeke, both well known abroad. The summer was evidently spent in daily practice, for the four men played with a precision and a sympathetic understanding that were astonishing. The offerings were a Mozart quartet in D minor, Beethoven's quartet, opus 57, No. 1, and Brahms's lovely C minor trio, in which Mr. Ganz took the piano part. Altogether the performance was such as to make the audience grateful that Mr. Kneisel was persuaded by his friends to refuse the offer of the conductorship of the Philadelphia Orchestra, an offer which, if accepted, would have ended the career of America's best chamber music organization.

Paderewski will be the soloist at the Boston Symphony concerts in Carnegie Hall this evening and Saturday afternoon, December 7. He will play Beethoven's concerto in E-flat major, "The Emperor," tonight, and Rubinstein's concerto in D minor, No. 4, on Saturday afternoon. This will be his only appearance in New York with an orchestra, and he will play only twice more here. His third recital will be on Saturday afternoon, December 14.

The elder Coquelin used to say that he lost 500 francs every time he acted at the Comédie Française instead of accepting more lucrative engagements elsewhere. Famous French singers might say the same thing regarding the Opéra. The Minister of Fine Arts pointed out the other day that the monthly compensation of the singers is in many cases surpassed by a single night's emoluments in America. The most high-priced singer at the Opéra is Alvarez, who gets $1,600 a month. Breval, the leading prima donna, has $1,500. At the Opéra Comique Mary Garden got $1,400 a month, and Clement gets $1,500. The average receipts per performance at the Grand Opéra last year were $3,357, and the five most popular operas were "Ariane," "Faust," "Salammbo," "Samson and Dalila," and "Die Meistersinger." At the Opéra Comique the receipts averaged $1,400, and the most popular operas were "Manon," "Madame Butterfly," "Carmen," and "Pelléas et Mélisande."

Art.

Painters and Sculptors: A Second Series of Old Masters and New. By Kenyon Cox. 8vo; 72 illustrations. New York: Duffield & Co., $2.50.

Several of these essays have already appeared anonymously in the *Nation*; but we see no impropriety in saying that these new excursions of a painter in the field of criticism will be generally welcome; for, aside from his specific professional equipment, Mr. Cox commands certain qualities which are rare in writers about art. Saying clearly and well what he has to say, he eschews mere rhetoric. Disclaiming connoisseurship, his scholarship is adequate, while his insight as a painter, as in the essay on Holbein, at times affords discoveries that the connoisseurs have missed. Above all, he is judicious, weighing gingerly his personal admirations, and straining a point to do justice to a colleague, like Leighton, to whom the mode pays scant respect. Indeed, this impartiality amounts at times almost to a foible, depriving certain essays of any marked personal flavor.

As a whole, the book lacks the consistency and dignity of the first series, though containing, in the Holbein and Rodin, two of Mr. Cox's best pieces of criticism. Possibly, the material covers too wide a range. In the preface, for example, he moots the old dilemma of the artist as critic, arriving at the result that laymen frequently write bad art criticism, a statement that will hardly be disputed; and that artists, barring mere stylistics, generally write good art criticism, a truth that Mr. Cox himself has notably illustrated for a matter of twenty years. We want, in short, for either class simply a fair field, and no favor—a demand so obviously just that it is hardly worth while to put it into a preface. Discussing the Education of an Artist, our author shows himself the candid friend of the modern art school. It is a poor thing, he admits. It teaches practically nothing about painting, and actually nothing about artistic design. But, with all its defects, we must put up with it, since no better substitute is at hand. From the revived practice of mural painting, he hopes for a limited return to the old system of apprenticeship. It seems to us that Mr. Cox fails to strike the real grievance against the art school, which is that it does not even teach what it professes to teach, namely, drawing. It does teach a form of lifeless mechanical draughtsmanship which permits the pupil to represent with approximate correctness the contours of any object before him. But this is not drawing at all, as artists and even lay critics use the term. To see what fine drawing really is, one need only consult *passim* the essays on the Pollaiuoli, Rembrandt, and Holbein in the present volume.

Anent the death of Alfred Stevens, Mr. Cox has strung on a slight chronological thread a number of painters of the mode, from Holbein down. The paper is pleasant reading enough, and doubtless served its turn well in a popular magazine, but hardly seems of a substance to merit reprinting here.

It is a pleasure to pass from this and

other *collectanea* to such admirable essays as the Holbein, Rembrandt, and Rodin. The Holbein particularly is a substantial contribution both to connoisseurhip and criticism. Mr. Cox convincingly attributes Holbein's curious reversal of form in his later work to the ruling fashion of portraiture in England under the Tudors. We thus find the almost unexampled development from full chiaroscuro and a rather thick pâte to shadowless, thinly painted forms, as flat, except for their exquisite contours, as a queen of cards. How Holbein wrung a triumph out of this tyrannical imposition is Mr. Cox's theme. He treats also the superlative beauty of Holbein's enamel, the painterlike qualities of the man, with more thoroughness and sympathy than any predecessor within our knowledge. The essay on Rembrandt, an address on the occasion of the Tercentenary, is so good and comprehensive that we should be glad to see it supersede that in the First Series. The later study catches more simply the isolated character of this art, its strange combination of the imaginative and the merely fantastic, its passionate absorption in the daily drama of light and darkness. its dæmonic manual ability.

The Rodin will seem a "cooling card" to unreserved adorers of this turbulent genius. It seems to us to grasp the fundamental limitation of this art, its lack, possibly its deliberate abnegation, of monumental quality, its exaggeration of its cardinal principle of penumbrage (admitting the word). It is perhaps worth while recalling here that technically Rodin has merely carried into large sculpture a kind of picturesqueness that recurs over and over again in fine small modelling of all periods. In the figurines of Clodion and Pradier, for example, one may find interesting anticipations of this mode. His innovations are rather temperamental than technical. In a certain drastic sensuousness his analogues are to be found, as we believe he himself admits, in late Gothic sculpture.

But in all these matters we refer the reader to Mr. Cox. In him they will find that "agreeable leading" which the new pragmatism assures us is the infallible test of truth, without missing the more old-fashioned guarantee of a certain austere probity.

The leading article in the *Burlington Magazine* for November is an editorial suggestion that the income of the Chantrey Fund for a number of years should be devoted to the completion of the decoration of the houses of Parliament, towards which nothing seems to have been done for many years. We sympathize with the editor's feeling that British artists should be able to rise to the task of monumental decoration, and that to refuse to give commissions for monumental work until there is a body of trained and experienced decorative painters is to resolve never to go into the water until one has learned to swim. There are in this country, also, those who are so troubled by the errors of inexperience that they prefer to do nothing, and, as in England, they need to be reminded that it is through errors that perfection is finally reached, and that we shall never have a noble school of monumental art unless our artists are constantly afforded the opportunity for efforts in that direction. But the insuring of a decorative effect in mural painting is not quite so simple a matter as the editorial writer in the *Burlington* seems to think. His idea is that "there is a way of insuring that no painter of average capacity shall produce work that is positively undecorative, namely, by compelling him to work with only a moderate range of tones." A definite standard of tone is to be fixed, and "all tones lighter than the selected standard may be used, but the introduction of any tone darker than the standard shall disqualify the painting containing it." Such a restriction might, indeed, prevent some faults, but it would, of course, insure no virtues, and it would often quite uselessly handicap the real decorator. For the true decorator, from Veronese to Tiepolo, has always found the occasional use of nearly pure black, in small quantities, extremely valuable. The kind of breadth and lightness of tone desirable in decoration is not to be attained merely by restricting one's self to half-tone—that is a counsel of timidity. It is to be attained by an intelligent use of all one's resources, of which black is not the least. And the whole question of tone is, after all, a minor one. It is the question of design that is vital. The frontispiece of the number is a reproduction of a newly rediscovered early picture of Constable's, Dedham Vale, accompanied by an article by C. J. Holmes. The department of Art in America is occupied, this time, with American subjects, Kenyon Cox writing of the pictures by Winslow Homer in the Metropolitan Museum, and William Walton of New York's Art Commission.

A learned discussion of statues of the Dioscuri, by Giuseppe Cultura, is the leading article of the November *Bollettino d'Arte*. His point of departure is the colossal Dioscur found at Baiæ twenty years ago, and recently acquired by the Italian State. In all these great images the problem is to reconcile the rather archaic forms of the body with the Alexander-Helios type of the head. This anachronism makes it difficult to accept the old theory that most of the extant examples are copies of originals of the fourth century. Signor Cultura's suggestion is that the composite type is of Roman origin, corresponding to the Latin vogue of the Castor and Pollux cult. Greece, he thinks, borrowed the type in turn from her conqueror. This view runs with the prevailing tendency to admit a greater diversity and freedom in the eclectic sculpture of Rome. Arduino Colasanti publishes for the first time a St. Francis receiving the Stigmata, by Gentile da Fabriano. This exquisite early work is in the Fornari collection at Fabriano, where curiously enough exists also an old copy by Giovanni da Paolo of Siena—one more evidence of the imitative habits of this uneven painter. In the news section is reported the condemnation, on appeal, of a citizen of Verona for selling the balconies adorning the front of his own house, although these were not on the "inventory of precious objects." The Court of Appeals ruled that these carvings, having long been shown to all, "the public had acquired their enjoyment"—a sort of vested right to beauty. Such incidents make the selling or even the buying of antiques in Italy a fearful trade. But with small fines on a rising market it may presumably be endured.

Houghton, Mifflin & Co. have just issued a monograph on Augustus Saint-Gaudens, by Royal Cortissoz, illustrated with photogravure plates after twenty-four of that artist's works, including almost all his more important statues and a number of his medallions and reliefs. Mr. Cortissoz writes of the great artist's character from personal knowledge and fullness of sympathy, and of his art with much insight and discrimination. The only fault to be found with his essay is a certain lack of incisiveness in his smooth and easy style. He sees rightly what are the qualities of the work he is discussing, but either he does not see very sharply or he is not able to convey in language a definite image of what he sees. His portrait is a true one, but it is a trifle blurred. There are several unaccountable errors in Mr. Cortissoz's notes on particular works, printed as descriptions of the plates and apart from the text. Thus the relief of the artist's son, Homer Saint-Gaudens, is described as "one of the earliest medallions he produced," though it is dated five years later than that of George W. Maynard, reproduced in this volume, and two or three years later than four other medallions here illustrated. The medallion of C. C. Beaman is said to have been "modelled in the early eighties," in spite of its exceptionally clear inscription which dates it 1894. Finally, of the Columbus medal Mr. Cortissoz says: "Of the two designs made by Saint-Gaudens the second was adopted. The reverse of the one abandoned has a special interest," etc. This is misleading. Saint-Gaudens made two designs for the reverse of this medal—only one for the obverse—and of the two designs for the reverse neither was adopted. The clumsy composition actually used was by another hand. The plates are well executed, but are not always from the best attainable photographs. The great statues suffer more in this way than the medallions, as also by the great reduction in scale. The book is handsomely printed and got up, and will prove, in spite of the minor errors commented on, a desirable possession.

A new book by Bernhard Berenson is an event of some importance, and he has now concluded his series of studies of the Italian schools by issuing "The North Italian Painters of the Renaissance" (G. P. Putnam's Sons). The book has all the characteristics of its predecessors, but it does not deal with so interesting a subject. Except for Mantegna and Correggio it treats of hardly any artists approaching the first rank, and instead of showing us why this or that colossus is colossal, Mr. Berenson is, in the main, occupied with showing us why this or that pygmy is no larger. Even as regards his two great men, Mr. Berenson is more anxious to show why they are not the greatest than why they are great. Of the most of the men he discusses, it may fairly be said that, in a larger view, it matters very little what they did or why they did it. In short, this volume's importance is that it is the negative end of Mr. Berenson's demonstration of his theory of art, as its companion volumes were the positive end. He is now dealing with the absence of his three great qualities, tactile values, movement, and space-composition, as he has before dealt with their presence, and the burden is ever the same—these are the things that make serious art, and in

their absence art ceases to be serious. Near the end he confesses that color deserves more attention than he has given it, and expresses the hope that some day he may be able to repair the deficiency. His mature views on that element of art cannot fail to be interesting, and one hopes that his "some day" may be an early one. At the end there are the usual tables of works by the artists, considered in the text, and Mr. Berenson's attributions will probably arouse the usual amount of discussion among the experts.

Dr. Max Kemmerich's "Die frühmittelalterliche Porträtmalerei in Deutschland bis zur Mitte des 13. Jahrhunderts" (Munich: Calwey) is a carefully written and interesting work from an historical as well as from an artistic point of view, giving a clear and consecutive survey of mediæval portrait painting in Germany from the eighth to the middle of the thirteenth century. Early portraits of this period, as is evident from those preserved in the few illuminated manuscripts transmitted to us from the time of Charlemagne, lack individuality, the artists aiming chiefly to show by apparel, attitudes, and various attributes the office or rank of the persons portrayed without attempting to delineate marked peculiarities of the features, color, expression of the eyes, and other distinctive characteristics. Some improvement in these respects is perceptible about a century later, under Charlemagne's grandson, Charles the Bald, but the highest development in this direction was attained during the reign of Otto III., in the last decades of the tenth century—a progress, however, not at all due to the initiative or influence of these sovereigns, who are here mentioned only for chronological purposes. The author obtains his material almost exclusively from illustrated manuscripts, Bibles, codices, liturgies, and other such sources. The book contains a list of more than 350 portraits of early mediæval persons, a number of which are reproduced, and some of them for the first time, thus adding to its attractiveness and value.

The Municipal Art Society of New York will hold its seventh annual exhibition at No. 119 East Nineteenth Street, in March, 1908. The exhibition will include proposed or completed schemes in decorative painting and sculpture, landscape gardening, drawings or photographs of municipal architecture of a decorative or monumental character; civic centres and improvements in American and European cities, fountains, stained glass, mosaics, models of work executed in stone, wood, bronze, or wrought iron; street fixtures, bridges, maps of proposed parkways, park fixtures, window boxes, and similar objects which illustrate phases of municipal improvement.

Among the exhibitions at the dealers' shops in this city are pictures by John La Farge at Macbeth's till December 12; miniatures by Alyn Williams, president of the Royal Society of Miniature Painters, England, at Arthur Tooth & Sons'; Barbizon and modern Dutch paintings, Theodore C. Noes's; early English, French, Dutch, and Flemish masters, Blakeslee's.

Finance.

AFTER THE PANIC.

The end of partial suspension of cash payments by the banks is plainly in sight. Whether other cities will return to a cash basis simultaneously with New York, is a disputed question; but in any case general resumption cannot be long delayed. With such resumption, not only will the currency premium disappear, but huge hoards of cash will return to the banks for deposit. Blockade of exchange between interior cities will be broken; the wheels of commercial machinery will again move freely; "token money" will disappear; and mills, shut down merely for outright lack of currency will start up; Stock Exchange prices will seemingly declare that the panic of 1907 is over.

What then? Paul Leroy-Beaulieu's Paris *Economiste* has prophesied that "a season of reaction is in store, not for a few weeks or a few months, but for several years." Not many American prophets have publicly taken such positive ground. Roswell Miller of the directorate of the Chicago, Milwaukee and St. Paul, said last week that "business will not recover from this reaction for several months." Stuyvesant Fish declared the country to be "confronted with a period of depression which must of necessity last until confidence is restored," and the only basis for such restoration he believed to be "house-cleaning" by corporations in whose management the country has lost faith, or punishment of the guilty officers. This would take more than "several months." President W. H. Truesdale of the Lackawanna predicted better things "after a period of reaction"—whether of months or years, he did not say. James J. Hill observed that the country "needs the rest cure," that "we all want to go to sleep for a good long time and wake up with both eyes open." But Mr. Hill did not say how long the sleep should be. Reasoning on somewhat different lines, Sir Felix Schuster, one of the most far-seeing London bankers, declared that "the United States out of its own resources would ultimately overcome the present troubles"; but he did not say when "ultimately" would be.

What have we ahead of us? In his heart, every financier and business man of experience will answer, A long period of slackening trade, with incidental industrial depression, and a slow recovery. He feels this to be true, for two good reasons—one, that the blow has so injured the whole credit system that it cannot recover except after prolonged liquidation; the other, that general trade, quite as truly as financial values, has long been on an unnatural and inflated basis. This second assumption does not mean that the country's merchants have as a class been doing business in a speculative way. The fact seems to be that they have not; that they had distrusted the reckless tendencies of the day, and were sailing reasonably close-reefed when the hurricane broke. Had they not been doing so, we should have heard a vast deal more of mercantile failures since October 24. But what the man of experience knows quite as well, is that even where producers and middlemen have not been rashly abusing credit, consumers have. The buying capacity of the community as a whole has been radically cut down by the shock; excesses in the scale of living must perforce be abandoned; retrenchment instead of lavish expenditure will become the social virtue; and all this means that for a good while to come trade demand will contract and production will decrease. The community as a whole must now set to work to pay its debts, and debt-paying does not mean continuance of a "boom."

There are reasons for hoping that the parallel with the panics of 1893 and 1873, so remarkably close up to the present moment, may not be so exact in the longer sequel. The aftermath of those older American panics was three years of genuine hard times on the one occasion and four on the other. But we are not burdened with the bankrupt industrial West of 1893. To-day the West is considering, not where it will borrow when panic is over, but where it will lend. Nor is the country as a whole the semi-insolvent debtor to Europe as in 1873; we are still largely in command of the international exchanges; we have paid off our foreign debt, and we have a vast reserve of resources which Europe, willingly or not, must buy from us. The extent to which these factors will in the next few years offset the inevitable hardships of forced and prolonged industrial liquidation will soon be evident.

A THIRD REVISED EDITION OF

Pancoast's Introduction to English Literature

By HENRY S. PANCOAST. ix. + 656 pp. 12mo, $1.35

Apart from its use as a text-book, this is recognized as one of the best handbooks available for the general reader. It has now been rewritten thruout, and reset in larger type. Greater space has been given to the early and Middle English periods and to the literature of the Queen Anne and Victorian periods. The revised study-lists and chronological tables, greatly enlarged and improved, are now issued separately in pamphlet form.

Of the book in its previous form, *The Nation* said: "It is enough that it treats the history of English Literature as closely connected with general history and that the style is interesting, the conception broad and clear, the biographical details nicely subordinated to matters more important, and that not even the dullest pupil can study it without feeling the historical and logical continuity of English Literature."

HENRY HOLT AND COMPANY 29 W. 23d St. NEW YORK

STUDIES IN POETRY

By STOPFORD A. BROOKE

Author of "Tennyson: His Art and Relation to Modern Life," etc.

8vo. $2.00 net

Lovers of literature will look forward with delight to this new volume by Stopford A. Brooke. In the present work his illuminating and critical pen deals with four masters of English verse of varied type, namely, Shelley, Scott, Blake, and Keats.

G. P. Putnam's Sons, New York and London

THE MARGINAL NOTES OF LORD MACAULAY

Selected and Edited by Sir GEORGE OTTO TREVELYAN, Bart. 8vo, pp. 65. $0.50 *net*. By mail, $0.56.

In this book is given a selection from the many notes which Lord Macaulay made in the margins of even the most trivial books, as well as in those of the highest rank—for instance, from Miss Seward's "Letters," to Cicero and Shakespeare.

MISS M. H. BUCKINGHAM,
96 Chestnut Street, Boston, Mass.

The Nation.

NEW YORK, THURSDAY, DECEMBER 12, 1907.

The Week.

The approaching transfer of practically the whole of our naval strength to the Pacific cannot fail to attract the attention of Congress. As to the motive of this extraordinary departure in our naval policy, the truth does not yet seem to have been told. The common excuse is that this is a practice cruise for our battle fleet, and much ado is made about the value of the long voyage and the passage of the Straits of Magellan, just as if some ships of our navy were not making long voyages all the time. If the battleships now assembling need this experience at an estimated outlay of a million and a quarter of dollars for fuel alone, in order to bring their engineers and stokers up to a proper state of efficiency, then the national pride in them is not justified. The same schooling, it may be remarked, could be had on much cheaper terms in the Atlantic, with much greater efficiency as a result. Those who understand such things tell us that, to-day, the great weakness in the navy is the lack of training, on the part of captains and their understudies, in manœuvres, especially in those of actual engagement or battle tactics, so called; that the Atlantic Fleet, under its present commander, had only nine hours of these capital exercises prior to last spring, and about five days since then; and that, in the case of seven captains, even this experience is lost to the country through their having been replaced by younger men, who have everything to learn. Dissenting naval officers further say that the necessary fleet drills will not be carried on during the trip to California; and that, in this most essential respect, as one officer of the fleet expressed it, with pain and indignation, "A whole year will be wasted!" We are aware that a few naval officers feel, as Capt. Mahan writes in the current *Scientific American*, that the cruise is useful because its officers will have to face "the huge administrative difficulties connected with so distant an expedition by a large body of vessels dependent upon their own resources." But the bulk of the naval officers believe that the solution of this petty problem of coaling and victualling our ships in friendly South American harbors in time of peace, by a large number of vessels instead of by two or three, is of trifling importance compared not only with those battle exercises we have already cited, but with target practice and the real trying out of our ships. Far greater service can be rendered, according to the strict navy point of view, by testing our ships in elaborate manœuvres, in disclosing and repairing their obvious defects, than in taking a year out of their fleet development in order to ascertain if they can load coal and provisions promptly, and safely find their way in and out of foreign harbors.

The Republicans are profiting by the lessons of the past. Having elected by the greatest plurality in history one candidate nominated in a convention held at Chicago in the third week of June, they are going to nominate another candidate—or maybe the same—in a convention held at Chicago in the third week of June. If he wins, the party will doubtless do the same thing again in 1912. Efforts to hang portentous political issues on the selection of a convention city are always rather labored. It is unlikely that Taft's chances are really improved because his friends in the National Committee voted on Saturday with the prevailing side. The selection of a date has more real significance. Only five times in the last fifty years has Congress finished the deliberations of its long session early enough to adjourn before June 16. Once it adjourned exactly on that day. Twice it remained in session as late as October, and once till November. The selection of an exceptionally early date, compelling hurry, if even the routine work is to be completed, adds one more to the arguments for inaction.

Amusing, indeed, are the comments of some of the Washington correspondents upon the absence of any Hughes boomer at the meeting of the Republican National Committee. The Hughes movement has, we learn, suffered a serious check thereby, or it has gained tremendously by this show of independence. You can pay your money and take your choice. But the puzzlement of the politicians is complete. What kind of man is this who toils not, neither does he spin, in the ways that are familiar to them, but whose influence and spirit are more and more abroad in the land? Take the announcement of Mr. Hughes's secretary that the Governor has not engaged any "headquarters" in Chicago, and will not. Naturally, the politicians ask if he is bereft of his senses, or if he wants the nomination at all. They look with contempt on a man who has a splendid chance for the nomination, and yet will let no one lift a hand for him. Surely, such a man has something wrong in his upper story. They cannot understand that those who will decide this nomination are not themselves, or even Mr. Taft and Mr. Roosevelt. If the party makes up its mind that it wants Hughes, it will be of no consequence what the political managers try to do. Least of all, will the Governor of New York suffer by the attitude he has assumed. The people of this country, if we are any judges, are ready for a man who looks upon the Presidency not as a prize to be striven for, but as an overwhelming duty that cannot be honorably shirked if the demand that he assume it be unmistakable and overwhelming.

In his annual report the Secretary of the Treasury follows the President's example and makes no definite suggestions regarding currency reform. This is doubtless the Secretary's recognition of the fact that, in the light of recent events, legislation must now be framed with great deliberation. The chief matters of interest in Mr. Cortelyou's report, therefore, are his review of the Treasury's relief measures during the New York bank run of October, and his forecast of the national finances. The story of the prompt and timely deposit of government surplus with the banks at the height of panic, tells little that the community did not know before. That the Secretary moved slowly in putting out his surplus during the weeks before the panic; that he thus kept in hand a substantial relief fund for the real emergency; and that when the panic actually came, his action was unhesitating and thoroughgoing, though always in obedience to the law—with all this the community has been familiar; and to the executive capacity thus shown the Clearing House Committee and the public at large have paid their tribute. But for this prompt action, a series of disastrous failures of powerful banking institutions would probably have been inevitable. As against the $84,236,000 of surplus revenue for the fiscal year ending June 30, 1907, the Treasury estimates $42,000,000 surplus for the twelve months ending with next June. We are unable to regard that estimate as other than excessive; it bears, in fact, rather strong evidence of having been compiled before the recent violent change in the conditions of trade and credit. Decrease of $20,000,000 in the customs revenue is conceded, which may at first glance seem allowing much for reaction. But as a matter of fact, even that reduction would leave the fiscal year's receipts from import duties nearly $12,000,000 ahead of 1906, and much more in excess of any previous twelvemonth in our history. It must now be recognized that our abnormally large imports of 1907 were themselves one symptom of that infla-

tion of prices and credit which led to this autumn's crash. A similar prediction, made at exactly this time in 1893, by Secretary Carlisle, and forecasting the revenue of the first half of 1894, turned out an over-estimate by the substantial sum of forty million dollars. November alone, as reported on in the monthly bulletin of last Thursday, shows a decrease of $10,000,000 from the revenue last year. These facts ought to be seriously impressed on the mind of Congress, in laying plans for future public expenditure.

In a time like this it is inevitable that the old quack-notions about currency should be trotted out. Last Monday a bill was introduced to "base" money upon cotton. In the prolific days of 1893-96 there was a great crop of these "basing" plans. Iron in the mines, coal in sight, hay in bales, etc., were proposed as the true security on which to issue currency. The simplest way, of course, is that which Tom Watson urged upon the President, to "base" your currency on nothing, and just issue greenbacks to fill every pocket. But this is to overlook one important difference between the present condition of the Treasury and that of 1893. Then the government was short of funds; but today it has more than $200,000,000 of surplus. If greenbacks were "issued," they could only be in payment of government obligations or purchases of some kind; they are not tossed out of the window to the crowd, as Mr. Watson seems to suppose. With over $200,000,000 to the good, the Treasury would look foolish to put out promises to pay. For the same reason, it looked foolish in putting out bonds and 3 per cent. certificates.

President Roosevelt could do no other than comply with the request of the Governor of Nevada that Federal troops be sent to Goldfield. If a sovereign State cannot protect itself from domestic violence, the Constitution makes it the duty of the Government at Washington to come to its aid. The reproach, if any, lies with Nevada. It is stated by the indignant officers of the Western Miners' Federation that there is really no trouble at Goldfield; that the sheriff has not called for assistance. But blunt Gen. Funston has information that the sheriff is himself a member of the Federation, and would do nothing to interfere with its pleasant habit of setting itself up above the law. Moreover, Gov. Sparks is very specific and detailed in recounting the acts of intimidation and violence committed by the Federation. In view of his appeal, there was nothing for the President to do but order the troops to go to the scene; and he deserves praise for the promptness and vigor with which he set about rescuing Nevada from terrorism and possible bloodshed. Here is no question of State rights, or usurpation of power; only a case of putting down lawlessness.

The Rivers and Harbors Congress at Washington last week was notable for the absence of sectional pressure and insistence upon particular local projects. Vice-President Fairbanks, Secretary Root, Speaker Cannon, and Chairman Burton of the House Committee on Rivers and Harbors have all emphasized the need for considering the question of waterways improvement in its larger aspects. "A policy, not a project," was Mr. Root's happy way of expressing the idea. If within the next twenty years we are to have a comprehensive system of developed waterways, these should come as the result of a consistent plan, and not a mere combination of a multitude of log-rolling projects which merely happen to dovetail together. This year's meeting, by its clear statement of this fact, may have opened a new chapter in the history of this branch of our national activity. While a good deal has been accomplished in recent years toward systematizing our river and harbor expenditures, this has been in spite of the efforts of those interested in improvements, rather than because of them. The representatives, official and unofficial, from each locality have been working for one or two pieces of work, and if these were provided for, the rest of the waterways budget might, for all they cared, fall into chaos. The attitude of this year's Rivers and Harbors Congress may be due in part to the realization that the right way is to begin at the other end. Once the country is convinced of the wisdom of liberal and continued appropriations for its waterways, the deserving projects will be attended to as a matter of course. It is now generally understood that both in respect to the handling of traffic and the maintenance of reasonable rates, we have long trusted too much to the railways. Instead of keeping our water-routes in condition to provide effective competition with the railroads, and, in periods of exceptional expansion like that of the past decade, to take care of the additional traffic in a natural way, we left them to the tender mercies of Congressmen who, while they did a great deal, in the aggregate, did not always do the things that were needed. To-day we need water transportation so badly that, as James J. Hill said to the waterways delegates, "You may be assured of the hearty support of the railroads in the construction of the legitimate waterways of the country."

The proposal to have the Federal government license automobile drivers comes before Congress for the first time in the form of a bill drafted by the counsel of the National Association of Automobile Manufacturers and the chairman of the Legislative Committee of the American Automobile Association. It is not proposed to create a separate class of Federally licensed cars, but merely to allow those already taking out permits in the State of ownership, to obtain certificates entitling them to make interstate journeys. The Federal government is appealed to, therefore, not to save the automobilist from over-drastic State laws, but to spare him the vexation of having to take out new licenses in every State he visits. The State legislation, as the author of the proposed law acknowledges in a recent compilation of the various automobile statutes, "on the whole has been fair and reasonable, and seldom do we find evidence of hostility carried to excess in any of the legislative enactments." But the States are not hospitable to the automobiles of their neighbors. No interstate boundary line, we presume, is crossed by so many automobiles as that between New York and New Jersey, yet New Jersey is inflexible in refusing to give credit to her next-door neighbor's licenses. The State laws differ widely in their requirements. Some States require all cars to be equipped with mufflers, some do not. Some allow cities, counties, and villages to make regulations of their own, some prohibit local legislation. A New York owner may keep the registration numbers of other States fastened to the rear of his machine; a Massachusetts owner at home must remove all but that of his own commonwealth. A motor bicycle is an automobile in Indiana, though a traction engine is not; both are automobiles in New Jersey, neither in New York. And so it goes. It is not at all unlikely, in view of the history of other legislation, that the mere drafting and introduction of the Federal bill will help on the cause of uniform legislation, its clauses being used as models before Congress has approved them. "It is hoped," writes the law committee of the Automobile Club of America, "that this will eventually form the basis for homogeneous legislation throughout the Union." Altogether aside from the Constitutional obstacles, it is very much better that such uniformity should come through voluntary coöperation of the States than through the too familiar short-cut of Federal intervention.

Statistics show that 96,724 immigrants returned to Europe during November, 55,000 more than a year ago. Never before has labor been so mobile. If what we are seeing now, the prompt departure of surplus labor when there is an industrial depression, is to become the rule, the intensity of future periods of suffering in any given country is certain to be much diminished. In our present crisis, this loss of workmen is doing much to mitigate the inevitable distress

of the coming winter. Moreover, if matters improve, labor will begin to flow back next spring as quickly as it is leaving now. Of course, labor leaders will not be altogether pleased by this demonstration that labor is becoming more and more fluid. They will perceive that this makes it more difficult to organize and maintain strong unions. Their ideal is a state so controlled that no one can come in without a permit from them, and no one leave, and that trades may be so regulated after the manner of the guilds of mediæval days that only a small number of apprentices can be accepted each year. In this way they would see to it that wages were regulated, and that there was "work enough to go around." The leaders' influence has for years been in the direction of keeping labor at its given task and opposing the introduction of machinery or anything that would tend to displace workingmen and cause them to turn their hands to something else. Obviously, if 500,000 or more workmen are going to bolt every time there is a financial crisis, and settle elsewhere, or go into other lines of employment, this little plan is going to be spoiled.

Oklahoma has already given so many evidences of enterprise, ingenuity, and courage of convictions that we are not surprised to find the new Commonwealth undertaking to write down the unwritten law. Senator Clarence Davis of Bristow is drafting a bill which by implication, we presume, takes the *dementia Americana* from the catalogue of forms of insanity. This is all very well in itself, but can a free people, brought up on the unwritten law, get along without any such refuge in the future? Will not adroit criminal lawyers presently invent a new unwritten law which is milder yet? Having legally exempted one species of homicide from the penalties of the law, is there any guarantee that the rest of its prohibition will remain unaffected? The doctrine of the unwritten law, as we customarily have it, is overladen with noble sentiment. It turns to its own purposes a resentment which is common to right-feeling persons. But at bottom it is merely an assertion of that right of private vengeance which civilized society has spent some centuries in trying to abrogate completely. Much may be said on the text that if juries remain unwilling to convict criminals of a certain class, it is best that the law should not require them to perjure themselves incidentally. With the notion, however, that the whole problem is disposed of by extending the statutory definition of "justifiable homicide," we have no sympathy.

The death of Oscar II. of Sweden has naturally been made a text for reference to almost the only event that came to cloud the last years of an otherwise happy reign. Yet it is an open question whether the peace of the Scandinavian peninsula and of Europe has not profited by the fact that Norway chose to break the partnership with Sweden while the aged monarch was still on the throne. In the crisis that followed Norway's declaration of independence the personality of Oscar II. made it apparent from the beginning that, so far as in his power lay, war should not follow the break-up of the Union. How deeply the King took that event to heart he did not hesitate officially to declare to his former Norwegian subjects, and to the world in general. It is no reflection on the new Swedish monarch to believe that, had the separation been postponed until after the death of his father, the settlement could scarcely have been effected in so peaceable a manner. A young king, however discredited in present days may be the doctrine of the divine right of kings, would have hesitated before allowing so serious a diminution of his prestige, and, as he might have regarded it, even of his rights. On the other hand, the Norwegians, however irksome the Swedish connection had become to them, could not but find in the personality of Oscar II., and the fact of his long reign over them, a powerful counsel towards moderation.

Chamberlain and his fellow-protectionists in England have made much of the "Imperial" nature of their schemes, yet, strange to say, it is the greatest Imperialists who have given them the blackest eye. Lord Curzon, both while Viceroy of India and since, has been distinctly hostile to their tariff plans; and now comes Lord Cromer utterly to condemn them. In a recent speech before the Unionist Free Trade Club, he argued strongly that a protectionist policy would be fatal to the highest hopes of British Imperialism. There existed, he said, a large amount of "dormant Anglophobia" in the world, and it would be the pitch of folly to arouse this, by tariff taxes, in "the counting-house of every foreign merchant and manufacturer." Lord Cromer had no objection to hearing "the Imperialist drum," but "my contention," he declared, "is that if the instrument is properly attuned, it will give forth a free trade and not a protectionist or preferential note." With all his authority and power of statement, he threw himself against the Chamberlain proposals, toyed with by Mr. Balfour, and urged that, both on patriotic and party grounds, they now be "laid on the shelf." The whole speech was a stunning blow to the English protectionists, and they are still reeling under it.

Another sister-nation, as Mr. Kipling would call it, has joined the family circle of the British Empire. Orange River Colony, formerly the Orange Free State, has just held her first Parliamentary elections, self-government was formally inaugurated a fortnight or so ago, and the newly elected Parliament is to assemble shortly before Christmas. Out of a total of 38 members in the lower house, the Dutch party has elected 30, the Constitutionalists, or British party, have 4, and the Independent party the same number. The Orange River Colony Ministerial bench will look even more like "the Boer general staff" than is the case in the Transvaal, where the British element is far more numerous. The colony's almost exclusively agricultural interests make the political issues small in number. The two principal ones concern the school system and the colony's attitude towards the working of the intercolonial railways. Premier and Colonial Secretary Fischer is to have among his colleagues Gens. Hertzog and De Wet. The latter, who is to be Minister of Agriculture, would seem more fitted by his war experiences for some such post as Minister of Ways and Communications.

The French Academy is so frequently spoken of as a sort of post-graduate club where forty immortals loll about and pretend to be working on a great dictionary, that its character as a bureau for the encouragement of national endeavor is often forgotten. On November 22 the Academy held its annual distribution of prizes. These rewards are of two kinds: for literary achievement and for "virtue," specifically, the so-called *prix de vertu*. This year there was distributed the sum of 189,000 francs in prizes ranging from 10,000 to 300 francs, to about 100 beneficiaries. Such a number of rewards conferred every year constitutes a very definite form of encouragement in a country where official recognition is highly regarded and a small sum of money goes far. The customary discourse accompanying the distribution of the *prix de vertu* was delivered by Maurice Barrès. The Academy has a quiet delight in selecting its youngest members and most recently reformed enemies of established order, to pronounce formal eulogies on morals, patriotism, religion, and the like. In the case of M. Barrès, it is true that he turned over his new leaf some time ago, and has become prominent as a champion of the simple virtues. Yet it is interesting to have the Epicurean anarchist of "Un Homme libre" and "Le Jardin de Bérénice" present the two leading prizes for "virtue," of 300 francs each, to the parents of a peasant family of nineteen and of twenty-one children. "Such mothers," said M. Barrès, in a fine Rooseveltian refrain, "are saints and heroines."

WHAT AILS AMERICAN SHIPPING.

One of the topics treated in the President's message is the pitiful state of the American merchant marine. He advocates an extension of the ocean mail act of 1891. He laments, with the rest of us, that we have not to-day upon the sea a merchant fleet "worthy of the traditions of our past." What that glorious past was, and why the American sailor was famous have never been set forth more convincingly than by De Tocqueville in "Democracy in America." In his chapter on "The Commercial Prosperity of the United States," he discussed the superiority of Americans at sea. That this was due to "physical advantages which nature gives them" he denied; and in a passage which is absolutely relevant to our present-day debates, he said:

> The American vessels cost almost as much to build as our own; they are not better built, and they generally last a shorter time. The pay of the American sailor is more considerable than the pay on board European ships, which is proved by the great number of Europeans who are to be found in the merchant vessels of the United States. How happens it, then, that the Americans sail their vessels at a cheaper rate than we can ours? I am of opinion that the true cause of their superiority must not be sought for in physical advantages, but that it is wholly attributable to *moral and intellectual qualities.*

Tocqueville went on to explain his meaning by saying that the Americans of that day displayed "a sort of heroism in their manner of trading" across the seas. We quote further:

> The European sailor navigates with prudence; he sets sail only when the weather is favorable; if an unforeseen accident befalls him, he puts into port; at night, he furls a portion of his canvas; and when the whitening billows intimate the vicinity of land, he checks his course, and takes an observation of the sun. The American neglects these precautions and braves these dangers. He weighs anchor before the tempest is over; by night and by day he spreads his sheets to the wind; he repairs as he goes along such damage as his vessel may have sustained from the storm. . . . The Americans are often shipwrecked, but no trader crosses the seas so rapidly. And, as they perform the same distance in a shorter time, they can perform it at a cheaper rate. The European navigator touches at different ports in the course of a long voyage; he loses precious time in making the harbor, or in waiting for a favorable wind to leave it; and he pays daily dues to be allowed to remain there. The American starts from Boston to purchase tea in China; he arrives at Canton, stays there a few days, and then returns. In less than two years, he has sailed as far as the entire circumference of the globe, and has seen land but once. It is true that during a voyage of eight or ten months he has drunk brackish water and lived upon salt meat; that he has been in a continual contest with the sea, with disease, and with weariness; but, upon his return, he can sell a pound of his tea for a half-penny less than the English merchant, and his purpose is accomplished.

Now, what has happened to change all that? What has deadened American initiative and eaten out the heart of American daring on the high seas? It is beside the point to talk of disadvantages having overtaken us in the evolution of ship-building, or to say that competition in modern methods of foreign commerce is hard to meet. We labored under the disadvantages, as Tocqueville points out, in 1830-40, and for a decade later, but in those years there was an indomitable energy in the American character which enabled us to surmount them. We had then to encounter competition from long-established rivals, but we shrank not from the contest, and emerged from it triumphant. There seemed to be no end to American resource and skill and invention and intrepidity in building and sailing ships. If the chief causes of our success were thus, as Tocqueville maintained, "moral and intellectual," we may infer that our decline has been in part at least due to a decay in the mental and moral qualities which won for us our former success.

Allowing all that may be necessary for changed physical conditions, the deeper reasons for our loss of prestige on the seas must be sought in a new mental attitude of the American people. It is often said that our country has not thought it worth while to pursue commercial conquests beyond the ocean; that we had our own vast empire to develop, and that our minds have been given to the work in which the greater immediate profit lay. In this statement there is doubtless some force; but our interior development was going on apace from 1830 to 1860, at the very time when our supremacy on the ocean was at its pitch. Something has happened since to account for the fact that we now lag so far behind other nations in marine enterprise and inventiveness, that the old courage and determination to succeed at all hazards, and in spite of all obstacles, seem so largely to have departed. The decadence appears in other fields as well. In the development of the turbine engine, in making automobiles, in wireless telegraphy, for example, a blight seems to have fallen on the once famed Yankee inventor.

A powerful case can be made out by those who argue that it is the general governmental policies of the past forty years which have so transformed our bold self-reliance into limp dependence. During all that period we have exalted the doctrines of paternal care over those of self-help. We have fixed the habit of running to Washington for aid. Above all, we have, by our vicious system of protection, spread wide the notion that Americans are not able to stand on their own feet; that they must have artificial advantages, and law-made handicaps, or they will perish in the struggle of brains. That is the reason why our shipping problem has so long been attacked from the wrong end. Everybody has been whining for a subsidy or discriminating duties or a grant in aid; nobody has been going out to fight the battle in the old spirit. We may depend upon it, however, that until we somehow win back those qualities of mind and soul which once gave us the chief place among the mercantile marines of the world, we shall never recover it. Subsidies can never prop up a man who confesses he is beaten in advance. Let all the laws which hamper our ship-builders and ship-owners be repealed; let them be given a fair field and no favors, and then let the appeal be to the old American boldness and ingenuity and proud trust that we can do business and make a profit where Englishman or German can, and we shall be taking the true way to restore American shipping.

THE CAUSES OF REVOLUTION.

The rapid growth of Russia's population is accepted as supplying one great impulse towards revolution. The misfortunes of the war with Japan may have served to precipitate the crisis, the development of industries, accompanied by an increase in the number of factory workers, may have helped to prepare the field for radical ideas; but the agrarian problem is the key of the present difficulty. The peasants call for land and liberty, but for liberty as an instrument for obtaining land. European Russia is overcrowded. The allotments assigned to the peasant communities at their emancipation in 1861 were barely sufficient, if that, at a time when the population numbered 75,000,000; these allotments are inadequate to support a peasant population of 120,000,000 in 1905 out of a total population of nearly 150,000,000. Hence, increasing poverty, famine, plague, and discontent. The argument of increasing population is recognized as valid by both parties to the Russian dispute. The progressive elements cite it as proof of the need of change. The government quotes it as a justification for existing evils. "The peasants will breed" is a formula which shifts responsibility from the shoulders of Nicholas II. and M. Stolypin to those of Providence.

A second force that drives to discontent and revolution is the spread of education, and particularly of higher education. A poverty-stricken peasantry, an unhappy city proletariat, will not stir of itself. There must be mind to work on brute matter, and of late that guiding intelligence has been amply supplied by the Russian universities and technological institutions. If the population of the Empire has doubled since 1860, the university enrolment has quadrupled since

1873. There were 6,145 students in that year, 12,939 in 1885, 13,944 in 1894 (under the repressive rule of Alexander III. the growth was almost checked), and 19,394 in 1904. The number is not large when compared with the total population of the Empire, but it is large in proportion to tne comparatively limited constituencies from which the universities draw. Given even a compact body (as the Russian "intelligence" undoubtedly is) of even a score of thousands of physicians, lawyers, schoolmasters, and technicians working for a common cause, however various the motives, and the required leadership for stirring the heavy mass of the productive classes into revolt has been supplied. A low standard of living and a high standard of education, an excess of population and an abundance of ideas, famine and enlightenment—such are the two main causes of popular discontent.

Which of these two factors is the more potent? The temptation is naturally to lay stress on the material agency, on population. We may test the point by referring to India. There discontent has been rife for two years, though there are now signs of an appeasement of popular feeling. The authorities have agreed in alleging famine and higher education to account for the unrest. An enormous population and swelling college lists—that for instance, was the burden of Mr. Morley's exhaustive speech on the Indian budget, delivered in the House of Commons on June 6. If European Russia cannot escape famine with a population of fifty to the square mile, what shall be said of India, with a population of 211 to the square mile? And for Russia's 20,000 university students, India can show 45,000 graduates from the five great Anglo-Indian universities of Calcutta, Madras, Bombay, Allahabad, and Punjab (Lahore). Nearly 41,000 of this number, as Mr. Morley is careful to point out, are graduates from the academic and legal faculties, and it is among them that sedition finds its instigators and leaders. In Mr. Morley's own words:

> All graduates, or almost all, hope for employment in the public service; and many, very many, are permanently disappointed. Facile with the pen and unfit for any but sedentary occupation, these and the still larger number of undergraduates who have failed to take a degree form a large body of men, mainly discontented and ready to advocate any change, as no change can in their view make their condition worse. Their ranks are increased by those who have been dismissed for misconduct from public or private employ, and it is from these sources that the anti-British editor and agitator is not unfrequently recruited.

The mass of British opinion is in agreement with the implied vague regret that Great Britain should have been so ready to bestow the gift of the higher learning on her Indian subjects.

In so far as concerns India's population, one striking fact must be taken into consideration. Whereas in Russia the increase for the eight years from 1897 to 1905 is officially estimated at 14 per cent., the increase for the whole of India for the decade 1891-1901 was only 2.4 per cent., and half of this was accounted for by the enumeration of new areas. In the British provinces alone the rate of growth for the ten years was 4.8 per cent., the lower figures for all India being accounted for by a decrease of 5.4 per cent. in the native states. In India, therefore, the British administrator cannot assert that his measures of relief are swamped by the unchecked upheaval of hordes of additional subjects. One great factor in his problem is nearly constant; and if dissatisfaction does come, he is right in ascribing it chiefly to education. The question Great Britain must ask is whether she will continue to encourage education at the risk of fomenting discontent. That England will do what the Czar has done and attempt to stifle university life, is incredible. After all, it is the idea that counts. France, with a population almost at a standstill, is more distracted with political and social agitation than any other European country outside of Russia.

BÜLOW AND HIS "BLOCK."

A Mecklenburger *Junker*, who admirably conceals under the manners of the man of the world the insolence common to his rank; whose ambition does not go beyond the desire to remain at the wheel; whose political talents extend only to the solution of momentary embarrassments; who does not seek to do great things, and therefore will not make any serious fight for his principles.

This is Theodor Barth's characterization of Chancellor von Bülow in the current issue of the *Neue Rundschau*. It smacks of prophecy, in view of the cabled rumor that the Chancellor threatened to resign last week because Dr. Paasche, the National Liberal vice-president of the Reichstag, severely criticised him and his policies; and its accuracy is further illustrated by the solution of that "momentary embarrassment." By calling the leaders of the "block" together, Bülow apparently got them to forswear any independence of action and to promise to support him loyally hereafter.

Of course, all this is no sign of strength on the part either of the Chancellor or of the unnatural alliance of Conservatives, Radicals, and Liberals. No thought of such a combination appears to have entered his head until the unexpected defeat of the Socialists in the last general election necessitated some new working majority, or a healing of that breach with the Clericals which was the ostensible cause of the dissolution of the Reichstag. It is a discouraging example of the readiness with which Liberal parties will compromise with thei. natural enemies for the sake of a few legislative crumbs, that the German Left now presents. Von Bülow's assurance that he would "do something" for the Liberals was enough to bring them to his feet, fawning, and quite ready to strike hands with the Conservatives, who represent the opposite of their political principles as nearly as does the Clerical Centre. The Conservatives oppose the democratization of the half-absolute kingdom of Prussia, and of the German Empire. Their sympathies are with the Prussian *Junker*, the Agrarians, and the protectionists, not with those who would establish a genuine manhood suffrage. For a statesman to attempt to carry on a government by riding these two horses going in opposite directions may indicate courage, but hardly principle or far-seeing wisdom.

Indeed, many Radicals see in the "block" nothing less than a cleverly contrived plan to delay the liberalizing of the country's institutions, for which the Left stands above all else. These Radicals are not to be caught by such chaff as the bill modifying the law as to public meetings, which, true to his promise, Von Bülow has already had introduced. On its face, this seems like a genuine concession to the Liberals. The Conservatives, too, will be pleased, because they have vigorous organizations, particularly their landlords' league, which are always agitating and campaigning. But the *Junkers* in the eastern provinces of Prussia control the police so wholly that people in that section will not make too free use of their new privileges And at best the bill does not remove from meetings that symbol of Imperial authority, the helmeted policeman, who listens to every speech, and decides with such intellect as he possesses whether a given utterance is or is not permissible. Indeed, it is currently believed that, under cover of this "more liberal" law, Von Bülow will try to have passed a brief statute forbidding political speeches in Polish on the pretext that enough policemen who understand Polish cannot be found to sit on the speakers' stands—a fine measure of the Chancellor's Liberalism!

Indeed, this Polish question may be precisely the rock upon which the Liberal-Conservative coalition will split. An anti-Polish measure just introduced in the Prussian Diet provides for forcible expulsion of Polish landowners from their estates; for the German colonization and land-purchase schemes for which the government has paid so many millions have wholly failed in their purpose of weakening the Polish hold upon the eastern provinces. A Liberal party which would sanction so indefensible a

measure would obviously forfeit public respect and all right to its name. The Liberals, in short, are being tempted in order to prevent their attacking the tariff and other evils. It is inconceivable that the Prussian aristocracy will make the slightest concession of value. Sooner than that, they would gladly renew their old friendship with the Centre, which is always ready to support the protective policy and the colonial and naval programmes.

Meanwhile the Chancellor is "sparring for time," and is, as Dr. Barth has aptly put it, going on with his "sham feeding" of the Liberal groups, so that he may get past the approaching elections for the Prussian Landtag without having to declare his real intentions as to the reform of the Prussian suffrage. Quite aside from the difficulty of keeping his majority intact, he has plenty of other hard problems. Germany is suffering somewhat from financial depression; the people are groaning under heavier and heavier loads, while the price of the necessities of life rises. Bread costs more than at any time during the last fifteen years, and coal is so expensive as to hamper industry as well as burden the householder. Bebel stated in the Reichstag recently that there are now in Berlin 4,481 school children who never get any dinner, and over 40,000 unemployed adults. Nevertheless, the new navy programme calls for an expenditure of $19,500,000 a year more than the high-water mark heretofore, and the army outlay is as heavy as ever. Naturally, therefore, there is talk of new taxes, higher duties, and of a government monopoly of all alcoholic liquors. That a Liberal party can long remain in league with a government that pursues a policy of this kind, and that it has actually promised to forego the right of criticism, seems at this distance quite incredible.

MALARIA AND POLITICS.

One of the early writers on political science justly remarked that political theory, as a rule, attains its fullest development just about the time when the institutions on which it is based are passing out of existence. Now that malaria has been banished from scientific speech by resolution of the International Sanitary Congress at Mexico City, and its place taken by "mosquito fever," it is something of a coincidence to come across a little volume entitled "Malaria," which would bind up that name with a far-reaching theory of historic evolution. The book is no less daring than suggestive. Its thesis is at once indicated by the sub-title, "A neglected factor in the history of Greece and Rome," and is summed up in a single sentence from the introductory chapter:

> The suggestion is that the conqueror of Greece was not so much the Macedonian or the Roman as that great tyrant which now holds half the world—malaria.

The little volume of 108 pages acknowledges three authors—Major Ronald Ross, whose epoch-making research into the nature of malaria brought him the Nobel prize in medicine in 1902; W. H. S. Jones of Cambridge, England, who contributes the main contents of the volume in the form of a study of malarial fever in ancient Greece and Rome; and G. S. Ellett, who has a concluding chapter on the effects of malaria on morals.

To make the point that the decline of Greece was due to the sapping of the national strength by insidious fever, it is necessary to show, of course, that malaria was not widely prevalent when Greece was in a flourishing condition. The authors find in Homer only one example of any term that might possibly designate malaria. After Homer such terms do not occur again before Aristophanes, that is, towards the end of the fifth century B. C. To follow the argument in detail is naturally impossible, but we may quote the "conclusion":

> Malaria was certainly prevalent in many parts of Greece, including Attica, during the fourth century B. C., though Greece was not "highly infected" in the technical sense of the words, as used by Sir Patrick Manson. The evidence of language and the fact that older people were frequently attacked, suggest that the disease had been but recently introduced [by the armies returning from Asia]. The Greeks themselves noticed the effect of malaria upon character. The change which gradually came over the Greek character from 400 B. C. onward was one which would certainly have been aided, and was, in all probability, at least partially caused, by the same disease.

It may be mentioned here that, according to the findings of Major Ross, in present-day Greece nearly one million people, out of a population of some two and a half millions, are infected with malaria.

The theory we have outlined is advanced by the authors only in the most tentative way. Their object is not so much to reconstruct history as "to show how important it is to stamp out malaria as soon as possible. Most other diseases, however distressing to individuals, brace a people by weeding out the unfit; malaria plays no such useful part in the economy of nature." To the average reader, however, the historical implications of the question are fascinating. The modern historian, despite his efforts to write history so as to embody every phase of a people's life, rarely does weave the many subtle threads into his story; most often we have detached disquisitions on the Roman family, literature, art, morals, with a perfunctory attempt at bringing these into connection with the main narrative which still remains one of ships and kings and the sealing-wax on treaties and capitulations. The present volume swings far in the opposite direction. That it goes too far, however, is apparent. We may agree with Major Ross's assertion that "historians, when dealing with the rise and fall of nations, do not generally view the phenomena from a sufficiently high biological standpoint," without accepting in its entirety his statement that he sees no reason "to suppose that the Roman and the Megatherium were not struck down by similar causes."

But whatever influence malaria may have exercised on the course of history in the past, its present and future political importance, in common with other diseases more peculiarly tropical, can scarcely be questioned. This factor of disease enters intimately into what is accepted as one of the great problems of the future—the establishment of white dominion over tropical and sub-tropical Africa and Asia, and, more broadly still, of the dominance of the temperate zones over the tropics. If yellow fever and malaria, as Major Ross would be inclined to argue, are instrumental in rendering the Cubans unfit to govern themselves or the people of Colombia to build the Panama Canal, it is only a question of time before such diseases, unless stamped out, will reduce the more efficient northerner to the same level of incapacity. Great Britain's difficulties in India arise in large measure from the fact that the peninsula as a permanent home for the European has been found impossible. The effects of equatorial disease and heat on the white man are often so disastrous as to have given rise to the new disease, "tropical wrath," a condition whose symptoms are intemperance, lassitude, spasmodic violence, and appalling cruelty.

The tendency to base national greatness and national decay on physical rather than moral conditions—or, better, to identify moral with physical growth and decay—is apparent in the movement now so actively under way in Great Britain for checking the physical deterioration of the people. Francis Galton, the founder of the new science of eugenics; Prof. Karl Pearson, Sidney Webb, with G. Bernard Shaw as press agent, have been the leaders of a movement which, in more or less modified form, really constitutes one of the main functions of government in every civilized community—the conquest of disease. The great enemies, as we feel them now, are not malaria, but tuberculosis, cancer, and all other diseases that thrive on overcrowding and uncleanliness; but the principle involved is the same. The sentiment of humanitarianism is being increasingly reinforced by the desire to augment national efficiency.

THE VISION OF THE UNSEEN.

The death of Francis Thompson, an event noticed briefly in these columns, has attracted much attention in his native England, where his following, though small, seems to have been larger than here. A poet "of celestial vision" is the epithet by which Wilfrid Meynell describes him in the London *Athenæum*. He was, however, beset with bodily ailments:

> Like De Quincey, whose writings he took into his blood, Thompson had a nervous illness in Manchester; like De Quincey, he went to London and knew Oxford Street for a stony-hearted stepmother; his wealth like De Quincey's once, lay in two volumes, for he carried Æschylus in one pocket, Blake in the other; and the parallel might have further extension, were it to profit.

That is, like De Quincey, he "doctored himself disastrously with laudanum." These physical and intellectual affinities were shared by still another poet, James Thomson, who died in 1882, wrecked by drink. James Thomson, too, had taken both De Quincey and Blake into his blood. Thomson's "To Our Ladies of Death" was directly inspired by the sisterhood of Our Ladies of Sorrow in De Quincey's "Suspiria de Profundis," and Thomson's lines on Blake in London are a cry from his own solitary soul:

> He came to the desert of London town,
> Gray miles long;
> He wandered up and he wandered down,
> Singing a quiet song.
>
> He came to the desert of London town
> Mirk miles broad:
> He wandered up and he wandered down,
> Ever alone with God.
>
> There were thousands and thousands of human kind
> In this desert of brick and stone;
> But some were deaf and some were blind,
> And he was there alone.

The last line of the first stanza is a clear echo from the brook in the opium-eater Coleridge's "Ancient Mariner"—the brook

> That to the sleeping woods all night
> Singeth a quiet tune.

To this group we may add one more notable name, that of our American disciple of Coleridge, Poe. Blake, who was perhaps half-insane, needed neither alcohol nor drug to open his eyes to the world of strange shapes and terrors; but all the others—Coleridge, De Quincey, Poe, James Thomson, and Francis Thompson—may have owed in part either to stimulant or narcotic their clairvoyant powers, their penetrant insight into the infinite mystery of the night that encompasses our common daylight life.

In this peculiar quality they stand by themselves. We might call them poets of delirium or of phantasmagoria, but that these words carry too strong a connotation of brutishness or sheer irrationality. They are poets rather of the dream that unlocks the gates of heaven and hell. To Blake

> The Land of Dreams is better far,
> Above the light of the Morning Star.

And so it must have been to the author of "The Ancient Mariner," "Christabel," and "Kubla Khan"; and to De Quincey, with those prose passages from the "Confessions" and the "Suspiria," builded "upon the bosom of darkness, out of the fantastic imagery of the brain, cities and temples beyond the art of Phidias and Praxiteles, and beyond the splendor of Babylon and Hekatompylos"; to De Quincey who at the bedside of his dead sister heard a solemn wind begin to blow, "the saddest that ear ever heard. It was a wind that might have swept the fields of mortality for a thousand centuries, . . . the one great audible symbol of eternity." And Poe belongs among them, too, with his sombre imaginings of "The Raven" and of "Dreamland," a limbo of

> Bottomless vales and boundless floods,
> And chasms and caves and Titan woods,
> With forms that no man can discover.

James Thomson is perhaps less known, but no one who has read "The City of Dreadful Night" can deny his membership in the brotherhood:

> As I came through the desert thus it was,
> As I came through the desert: Eyes of fire
> Glared at me throbbing with a starved desire;
> The hoarse and heavy and carnivorous breath
> Was hot upon me from deep jaws of death;
> Sharp claws, swift talons, fleshless fingers cold
> Plucked at me from the bushes, tried to hold:
> But I strode on austere;
> No hope could have no fear.

Francis Thompson's lines are often obscure, but that obscurity is broken, as in "The Hound of Heaven," by such flashes as this vision of the Eternal:

> I dimly guess what Time in mists confounds;
> Yet ever and anon a trumpet sounds
> From the hid battlements of Eternity;
> Those shaken mists a space unsettle, then
> Round the half-glimpsed turrets slowly wash again;
> But not ere him who summoneth
> I first have seen, enwound
> With glooming robes purpureal, cypress crowned;
> His name I know, and what his trumpet saith.

Accident can hardly account for the one striking trait that runs through all these writings, nor can we say that here is merely a product of poppy or vine. Far more likely is it that in their original bent these poets have burned with the passion of the mystic and the seer—coupled with physical infirmity that has made them slaves of a stimulant; and this stimulant has in turn heightened for a time their powers of expression and clad the phantoms of their imagination with richer colors and more dazzling light. Again and again we note the symptoms of disease, the fits of fever and despair, the flagging strength, the fluttering pulse, and now and then falling across the page the black shadow of death itself. And again and again we detect the working of the stimulant in phrases of almost superhuman vividness and grace, "and intellect miraculously bright."

But neither in their tears nor their laughter has the essence of their genius been displayed; rather in their mystical trances. For them our towers and gorgeous palaces, our solemn temples, and the great globe itself have been the insubstantial pageant, while the realities have lain where foot of flesh shall never tread and mortal eye shall never pierce. In this they show a kinship with the prophets and mystics of all races and climes, and, above all, with those Hebrew seers who beheld the holy city of Jerusalem coming down from above, the river of water of life clear as crystal, and the Ancient of Days, with raiment white as snow and throne of fiery flames. James Thomson in his rapture of despair saw the pit moved from beneath to meet him at his coming. Francis Thompson in his ecstasy saw on Jacob's Ladder

> To and fro
> In ascension and demission
> The star-flecked feet of Paradise.

But with visions as far asunder as hell and heaven, all these poets have clung to the one certainty that we are such stuff as dreams are made of.

GENIUS IN HARNESS.

Among recently published letters of Guy de Maupassant are several to his "cher maître," Gustave Flaubert, which illustrate many aspects of the literary temperament. There is, for example, its self-sufficiency, or persuasion that it has the whole truth in sacred deposit, as shown in Maupassant's plaint, when regretting Flaubert's absence, that he got nothing out of friends of his own age, since "they had not an idea of what is really going on." Sly digs at other writers, and other pretensions, occur in the usual manner of such correspondence. What most strikes one, however, is Maupassant's revolt at the need of work to earn his daily bread, when he would be wreaking himself upon his art. He tried his hand at book-reviewing, but found the task of literary *chroniqueur* repulsive. Then he got public employment. First, he was a clerk in the Ministry of Marine. Next, hoping for pleasanter colleagues and easier hours, he got himself transferred to the Ministry of Public Instruction. But he was disappointed. He was treated with great deference, consulted and praised, but he had no real "liberty," and that was what his artist soul craved. He dreaded that his talent was being stifled. The work was *embêtant*. He feared that his spring and hope would be destroyed by it. At one time, he mourned to Flaubert:

> My routine work uses me up. I cannot write anything. My spirit is wearied and sterile. I am oppressed by the uselessness of all I do, by the emptiness of the future (whatever it may bring), and I feel stealing over me a dejected indifference to everything. What I want is to stay quietly in

BURLINGAME PUBLIC LIB.

a corner, without aspirations and without stupidities.

It is an old grief. Charles Lamb at the India Office, Hawthorne in the Salem Custom House, Matthew Arnold reading endless school-examination papers, Poe penny-a-lining—the world has long been familiar with the spectacle of genius in the treadmill. How to get it out, there have been endless suggestions. Let there be special provision for geniuses: schools, endowments, support, encouragement, state patronage, so that no immortal works shall die in coming to the birth. *Hélas!* no practicable method has been found. An occasional father is wise enough and happy enough to put a talented son in funds; fortune sometimes capriciously favors the gifted; but in general the old rule still obtains. The bantling genius has to be cast upon the rock in order to determine whether it have the stuff of life in it.

There is, we know, a comfortable but callous doctrine that you can't keep genius, any more than a good man, down. It has been gravely affirmed that no creative work was ever really aborted by poverty or by bread-winning work which exhausts and deadens. But this is a good deal like some of the circuitous reasoning about the survival of the fit. Because they survive they are fit. And similarly because, in the nature of the case, you cannot confidently single out great works which an artist or a writer might have produced if he had had money, and therefore time and energy, it is argued that no such works ever would have been wrought, even in happier circumstances. But the logic is as poor as the comfort. People will go on lamenting the misfits of genius, whereby a delicate fancy has to earn a livelihood by toil befitting a boiler-maker; and the reason is because they cannot help feeling that a nice division of the labor of the world would give freer play to creative natures, and so minister not only to the content and full development of genius, but to the general joy and well-being.

Failing hope of any such beneficent arrangement, the chief consolation we have to fall back upon is that the system of making genius work in harness has come to be accepted, and that it is a part of genius to make terms with it. In America, at any rate, the art work as the avocation, even the by-product, is the rule. How many of our painters live by their art alone, with no teaching to do, no lecturing, no snapping up in every way of the unconsidered trifles of money without which the pot will not boil? How many American writers live, even oatmeal-fashion, by the literature which they cultivate? We suspect that the fingers of one hand would almost suffice to count them. Yet somehow the world goes on being peopled with books. Talent seems to be able, in one way or another, to keep itself from being made distraught by the noise and the demands of the day—something as Senators and Representatives manage to write letters and, we hope, think great thoughts, while the President's message is being read. Absolute genius finds such detachment harder, no doubt, but, then, absolute genius is rarer.

BUNYAN.

I.

There is no province of our literature more irrevocably lost to the present than that which sprang from the Puritan theology of the seventeenth century. Who to-day goes for the consolation of hope to "The Saint's Everlasting Rest"? or who reads the voluminous sermons which were the comfort of the saints upon earth? There was a little poetry produced that still echoes plaintively to the ears of living men—how little in comparison with the songs of the enemy! Marvell, indeed, we range among the Puritans, yet his most magnificent lines—

> But at my back I always hear
> Time's winged chariot hurrying near,
> And yonder all before us lie
> Deserts of vast eternity——

occur in a poem of frankly pagan sensuousness. He wrote an "Ode upon Cromwell's Return from Ireland," but he can only praise the victor as one who

> Could by industrious valor climb
> To ruin the great work of Time,

while the warmth of his fancy is reserved for the royal actor "upon that memorable scene." And Milton, who might seem an exception to the rule, is really the strongest proof of its validity; for his genius sinks just in proportion as he assumes the Puritan, and only the splendor of his native powers saved him in the end from dreary prosing. If his "Paradise Lost" were altogether, as he meant it to be, an argument to justify the ways of God to man, instead of the glowing pastoral it is at heart, what place would it have in our affections? Bunyan, too, is a great name. But of all the sixty books he is said to have written, who knows so much as the names of more than four or five, and who reads more than one? That one book has gone the circuit of the world, and has enjoyed a vogue second only to the Bible itself, speaking to the conscience of the vulgar and satisfying the taste of the fastidious. Nevertheless, so surely has the day of "The Pilgrim's Progress" waned that more than half a century ago Poe dared call it "a ludicrously over-rated book, owing its seeming popularity to one or two of those accidents in critical literature which by the critical are sufficiently well understood." Such condemnation is overdrawn, no doubt; but it is still true that within the last few decades the book has sunk from a work of powerful realism to a quaint allegory for the curious. Fathers, who remember how they were held spell-bound all a Sunday afternoon by the adventures of Christian, are chagrined to find that their own children listen to these coldly, or will not listen at all.

II.

In his "Grace Abounding," Bunyan relates that, as he lay in bed one morning, he was "most fiercely assaulted with this temptation, *to sell, and part with Christ.*" In his mind the wicked suggestion still kept running, "Sell him, sell him, sell him," as fast as a man could speak; until, overwearied at length and out of breath with contending, he felt this word pass through his mind, "Let him go, if he will," and he thought also that he felt his heart freely consent thereto. The burden of that sin might roll from him, as it did in time, but there was a denial of the higher imagination, not unlike it in character, which lies against almost all the writing of his school, and which has marked it for death. The continual redemption of the past is in the hands of those who have imagination, and whose interest falls naturally upon individuals and ages which lived by the same faculty. It is a rule from which there is barely, if at all, escape, that those who forget the past are in their turn forgotten. Now the lack of imagination among the Puritans showed itself in contempt of the arts and in many other manifest ways, but in none more clearly than in their violent break with the continuity of tradition. They had no patient eye for the lengthened chain of that Law, of which "there can be no less acknowledged," as Hooker wrote, having this weakness of theirs in mind, "than that her seat is the bosom of God, her voice the harmony of the world: all things in heaven and earth do her homage, the very least as feeling her care, and the greatest as not exempted from her power." This law they attempted to embrace immediately with the practical reason instead of leaving its dim perspective to the climbing vision of faith; and, doing so, they at once lost the true sense of the infinite as something that escapes the understanding and can be only shadowed in types and symbols, and they failed to perceive that the working of the law in human affairs is by that communion of spirit from generation to generation, whereby the past slowly ripens into the present. Their intransigeance was thus no more the result of moral conviction than of deafness to the voice which is "the harmony of the world." They were not aware that their refusal to distinguish between what Hooker calls "the rule of faith" and "the law of outward order and polity," and their consequent disregard for established custom with their proud ambition of new-creating a church-polity in accordance with the explicit decrees of God—they were not aware that all this was due to a dwarfed spirituality, unable to measure the heights and depths of being.

And this lack of imagination not only led them to "ruin the great work of Time," sundering generation from generation, but was the cause of endless present discord. "The world of imagination is infinite and eternal. . . . There exist in that eternal world the realities of everything which we see reflected in this vegetable glass of nature," said Blake, and in that sphere man, who "exists but by brotherhood," was to "put off in Self-annihilation all that is not God alone," and he everlastingly made one in the "divine humanity." Some such higher use of the visionary faculty we must hold in mind, if we would understand in what way the self-righteousness of the Puritans, which raised itself up to take heaven by storm, tended to cancel its effi-

cacy in clashing egotisms here upon earth. The extreme individualism of this creed must not be dissociated from their incapacity for that mystical self-annihilation in the divine, and the multiplied sects of seventeenth-century England were a direct consequence of the deadening of spirituality in legalism. It was not without reason that their exhortations were based chiefly on the Old Testament. "Why is the Bible more entertaining and instructive than any other book?" again asks Blake. "Is it not because they [the Scriptures] are addressed to the Imagination, which is Spiritual Sensation, and but mediately to the Understanding or Reason?" Now, there were Platonists then in England, half-Puritans, who lost themselves in a mysticism as vague as it was irrational, but they do not represent the national tendency. The Dissenters as a rule interpreted the Bible, not through the imagination which is spiritual sensation, but through the understanding. It was inevitable, therefore, that, when this enthusiasm died away, they should be found to have prepared England for the natural religion of the eighteenth century. And when this in turn falls into disrepute, they suffer rejection with the priests who are sponsors of atheistic rationalism:

> To cast off Bacon, Locke, and Newton from Albion's covering,
> To take off his garments and clothe him with Imagination.

III.

We shall miss the significance of Bunyan if we forget that he belongs to the age of Bacon, Locke, and Newton, and that his exasperation of the moral sense is the working of their conception of legalism in the religious sphere as contrasted with Hooker's earlier and Blake's later vision of law through the imagination. Here we touch his limitation, and here, too, lies his strength which will make him always a fascinating study for the dilettante and the literary historian after he has dropped out of living memory. The four works now published by the Cambridge University Press* contain all of his writing that the most curious are likely to find interesting; they vary in form, but their theme is substantially the same: the representation of the whole of life under the allegory of the virtues and vices. The first of these, and the most interesting, with the exception of "The Pilgrim's Progress," is the "Grace Abounding to the Chief of Sinners," as the title indicates, the story of his own conversion, a story of intense earnestness. "God did not play in tempting of me," he says in the Preface; "neither did I play, when I sunk as into a bottomless Pit, when the Pangs of Hell caught hold upon me; wherefore I may not play in relating of them, but be plain and simple, and lay down the thing as it was." Dates and ordinary events form no part of this remarkable autobiography, but enough is told to give a vivid picture of the man himself who wrestled with God for salvation. "For my descent then," he begins, "it was, as is well known by many, of a low and inconsiderable generation; my father's house being of that rank that is meanest, and most despised of all the families in the land." As a matter of fact, his father was a tinker, or "braseyer," as he signs himself, of Elstow, near Bedford, and his son John followed the same trade all his life and with good success. The boy was put to school, where he learned to read and write. He says that, to his shame, he soon lost the little that he learned, but somehow he retained enough, or in later life reacquired enough, to steep his mind in the language of the Bible and of Fox's "Book of Martyrs." The burden of his autobiography is the inherent and absolute evil of human nature—not the sense of man's feebleness and perversity such as has always been the theme of pagan and Christian moralists, but an immediate realization of sin as bearing with it the threat of eternal and unalterable punishment. His people walked in the continual fear of hell with a troubled uneasiness, not unlike the physical suffering we should endure if the crust of the earth were no more beneath our feet than a thin shell, trembling upon the central fires that threatened at every moment to break through and devour us.

"Alas," said Baxter, "it is not a few dull words, between jest and earnest, between sleep and awake, that will rouse a dead-hearted sinner." It needed the heavy hand of eternity laid on the quick, trembling soul to make vital this thought of the world as consisting of two infinite and mutually exclusive spheres of good and evil, of God and man, between which there was no medium of communication save the arbitrary, down-reaching arm of mercy. No one has a right to believe such things without going mad, said the jocular autocrat of Boston, and long before him Baxter used almost the same words: "Did we verily believe, that all the unregenerate and unholy shall be eternally tormented, how could we hold our tongues, or avoid bursting into tears, when we look them in the face?" The mind of man swings like a hanging pendulum, and Rousseau's faith in the essential goodness of human nature, with its implied denial of infinite consequences altogether, was the inevitable and equally exaggerated reaction from which we are only now beginning to recover. The Puritan and the Rousseauist stand at the two opposite poles of rationalism.

IV.

One thing is particularly remarkable in Bunyan's religious awakening—his complete immersion in the Bible. Other men of that age knew the Scripture as he did and quoted it on all occasions, but there is something peculiarly direct and intimate in Bunyan's relation to the holy words. They became the sap of his daily speech, and the perennial fascination of his written style is due to the perfect interfusion of Biblical language and the quaint idiom of the Bedfordshire roads. The sacred book was not to him a printed page or a conscious memory; it was nothing less than the living audible voice of God, appealing to his soul through the ears, and calling to him at uncertain intervals, as if he wandered stumbling in a country of hidden oracles. Sometimes the sound came to him within doors. "Once, as I was walking to and fro in a good man's shop," he says, "bemoaning of myself in my sad and doleful state, . . . and being now ready to sink with fear, suddenly there was as if there had rushed in at the window, the noise of wind upon me, but very pleasant, and as if I had heard a voice speaking, 'Didst ever refuse to be justified by the Blood of Christ?' . . . Then fell with power that Word of God upon me, 'See that ye refuse not him that speaketh,' Heb. 12.25. This made a strange seisure upon my spirit, it brought light with it, and commanded a silence in my heart of all those tumultuous thoughts that before did use, like masterless hell-hounds, to roar and bellow, and make an hideous noise within me." More often the oracle spoke to him in the fields as he went about his business: "Now, about a week or fortnight after this, I was much followed by this Scripture; 'Simon, Simon, behold, Satan hath desired to have you,' Luke 22.31, and sometimes it would sound so loud within me, yea, and, as it were, call so strongly after me, that once, above all the rest, I turned my head over my shoulder, thinking verily that some man had, behind me, called me; being at a great distance, methought, he called so *loud*." What strange gusts of terror and rapture must have shaken the soul of this tinker of pots and pans, as he walked about listening always for the very voice of God to strike his ears from the invisible haunts of space! Which of us to-day dare affirm that he really comprehends that sublimity? The very nakedness of Bunyan's inspiration is a check to his fame. I turn from him to that poor Welsh physician who, during these same years of national upheaval, was following the "pleasant paths of poetry and philology" in his native valley of the Usk. Vaughan, like the Bedford Baptist, was steeped in the language of Scripture, and to most of his poems he has affixed a text, as if they were designed to be sermons of quietness to his troubled people—"I'll leave behind me such a large kind light." But how different was the speech of the divine oracle to him as he, too, travelled up and down in his healing profession:

> My God, when I walk in those groves
> And leaves. Thy Spirit still doth fan,
> I see in each shade that there grows
> An angel talking with a man.
>
> Under a juniper some house,
> Or the cool myrtle's canopy;
> Others beneath an oak's green boughs,
> Or at some bubbling fountain's eye.
>
> . . . . . .
>
> Nay, Thou Thyself, my God, in fire,
> Whirlwinds and clouds, and the soft voice,
> Speak'st there so much, that I admire
> We have no conference in these days.

Here is the touch of imagination from which the Puritan conscience revolted, and, so revolting, shut itself off from the future communion of the wise. One thing was wanting to those strong men before the Lord, one thing which Wordsworth was to rediscover when the wave of rationalism for a while subsided:

> To look on Nature with a humble heart,
> Self-questioned where it did not understand,
> And with a superstitious eye of love.

They knew too surely, and they closed the *superstitious eye of love*.

V.

In due time Bunyan progressed so far as to become a preacher of authority among his own people, and even in London. He was naturally as a youth on the side of the Parliament in the struggle with Charles I., and for several years bore arms as a pri-

Life and Death of Mr. Badman and *The Holy War*. The text edited by John Brown, D.D. Cambridge English Classics. New York: G. P. Putnam's Sons. 1905.

Grace Abounding and *the Pilgrim's Progress*. The same. 1907.

vate soldier under Sir Samuel Luke, who is supposed to be the original of Butler's "Hudibras." But whether he became dissatisfied with the later Commonwealth, or whether his native sense of moderation in practical affairs came uppermost in time, there is reason to believe that he was among those who welcomed Charles II. back to England.

The event, however, proved disastrous to him. Within six months after the King's landing the laws against Nonconformity were revived, and Bunyan was thrown into Bedford jail. He had been forewarned of the arrest, indeed the justice who committed him seems to have been ready to make his evasion easy, but he would not promise to forego preaching, lest his cowardice should "make an ill savour in the country" and dishearten the timid. For twelve years, with one intermission, he was nominally a prisoner, part of the time being closely confined, and part of the time going free on parole. Granted the righteousness of the law, his treatment was by no means severe; at least his suffering was the world's gain, for in the forced meditation of those days he found himself and measured the strength of his genius. It was while suffering this restraint he wrote and published (1666) his "Grace Abounding," and composed the first part of "The Pilgrim's Progress." Between his release and his death, just before the Revolution, his larger influence as a preacher was exerted, and all but one of his principal works were published—the first part of "The Pilgrim's Progress" in 1678, the "Life and Death of Mr. Badman" in 1680, "The Holy War" in 1682, the second part of "The Pilgrim's Progress" in 1684.

VI.

Every one knows the beginning of his great allegory: "As I walked through the Wilderness of this World, I lighted on a certain Place where was a Den: and I laid me down in that place to sleep: And as I slept I dreamed a Dream." To how many of us those words are an *Open sesame* to the enchanted caves of childhood; hearing them we remember how all a Sabbath afternoon we would hang upon a dear voice repeating the adventures of Christian between the City of Destruction and the heavenly Jerusalem, and how in exquisite foreboding of the future we felt ourselves languish in Doubting Castle and shudder at the darkness falling in By-Path-Meadow. Naturally we cherish such memories and hesitate to believe that the new generation will never pass through that experience; we grieve to see one of the reservoirs of fruitful emotion dried up. But other times, other books; the very form of "The Pilgrim's Progress" makes us doubtful of its vital duration.

Now allegory is a mere matter of degree, and all good literature is in a measure of this class. The standing epithets of Homer show how the heroes of the earliest poetry were not entirely free from allegorical abstraction: Achilles is the personification of passionate valor, Odysseus of cunning, to name no others. So, too, we cannot separate Othello from the idea of jealousy, Macbeth from that of ambition; and these characters are none the less real, they are indeed more essentially human, because they have been moulded by the abstracting intelligence into partial types. And a good deal of Bunyan's work lies within the safe bounds of this artistic generalization. Now and then the odd names give a peculiar touch of realism to some subordinate character, such as "Temporary, who dwelt in Graceless, two miles off of Honesty, next door to one Turnback." And there is the famous Mr. By-ends of Fair-speech, who was related to "almost the whole Town; And in particular my Lord Turn-about, my Lord Time-server, my Lord Fair-speech (from whose Ancestors that Town first took its name:) Also Mr. Smooth-man, Mr. Facing both-ways, Mr. Any-thing, and the Parson of our Parish, Mr. Two-tongues, was my Mother's own Brother by Father's side: And to tell you the truth, I am become a Gentleman of good Quality, yet my Great Grandfather was but a Waterman, looking one way, and rowing another, and I got most of my Estate by the same occupation,"—there is much good talk in this amiable and frank Mr. By-ends. And if some of these characters are still flesh and blood beneath their allegorical devices, nearly all of the symbolical places along the way have passed into the currency of the common language. The Slough of Despond, the House of the Interpreter, the upper Chamber whose window opened towards the Sunrising, Vanity Fair, the Valley of the Shadow of Death, the Castle of Giant Despair, the Delectable Mountains—these are names (not all of them indeed invented by Bunyan, but made his own by the right of genius) that every man, now and hereafter, must pronounce to himself when he passes through the realities in the journey of life. We shall not entirely escape them, the most prosaic of us—not even the Dark Valley and the Delectable Mountains. It is no small praise thus to have mapped out the pilgrimage of mankind.

So far Bunyan preserves the balance of art between the reason which classifies life under abstract categories and the emotional faculty which reduces it to individual and unrelated experience; so far, in a word, he possesses the literary imagination to visualize the general in the particular. But when we consider his writing as a whole, we see how far it inclines toward the abstract. Now, allegory, more precisely speaking, begins just when the golden medium of the imagination is destroyed by an overbalance of rationalism, and to that extent all four of Bunyan's greater works fall within this frigid *genre*. Even the "Grace Abounding," notwithstanding the vividness of some of its imagery and the intensity of its personal emotion, has in the end the effect of allegory; the individual experience is overshadowed by the conception of life as a debate between two moral abstractions, man the personification of absolute evil and God the personification of absolute righteousness. The story of "Mr. Badman" abounds in minute scenes of which any novelist might be proud, and it has the unexpected excellence of showing Bunyan's native common sense in the rearing of children and other practical matters; yet as a whole it also resolves itself into a representation of absolute evil, here without the counter-balance of absolute good. In "The Holy War," the least human of his books, all the named virtues and vices are on the stage, playing their phantom parts; and the allegory is made doubly unreal by the fact that the universal scheme of salvation is so confused with the act of redeeming an individual soul as to keep the reader constantly perplexed to know which is meant.

VII.

In like manner it must be admitted by one who returns to "The Pilgrim's Progress" after many years that much of it belongs to a mode outworn. These Faithfuls and Helps, these friends named Pride, Arrogancy, Self-Conceit, and Worldly Glory, most but not all of these hobgoblins and angels that Christian meets by the way seem rather a childish substitute for the complexities of human nature. A good deal has been written to determine the sources from which Bunyan drew all these figures and the plan of his book. Resemblances have been pointed out to "The Fairy Queen" and to I do not know how many other books in English, not to mention foreign languages which the Bedford tinker could never have read. The real affinity of his work is with the old Morality plays whose spirit persisted in many disguised forms long after the drama of the Renaissance had usurped the stage. In those plays in which the soul of mankind is beset by all the virtues and vices, with the mouth of hell yawning on one side and heaven resting above, Bunyan would have acknowledged the true, but hidden, source of his inspiration. How like they were to his scheme may be seen from the list of characters appended to one of the Moralities, probably of the fifteenth century: "Nature, Man, Reson, Sensualyte, Innocencye, Wordly affeceyon, Bodyly lust, Wreth, Envy, Slouth, Glotony, Humylyte, Charyte," etc. It is a minor point that Bunyan, when he drops into rhyme, shows an uncouthness not unlike that of the ancient popular cycles.

The whole *genre* has something naïve about it, and one might suppose it would retain its undiminished power over the children at least of every generation. That it does not may be due to the artificial elements mixed up with the naïve, and in part also to the subtle influences that permeate an age, extending by invisible signs and accents from the old to the young. Unconsciously we transfer to the listening child a touch of our own indifference to this drama of the moralities. For allegory is a living thing only so long as the ideas it embodies are real forces that guide our conduct. Let us believe once more that life itself is a pilgrimage from inherited damnation to an eternal city beyond the river, let us believe that angels and devils are in deadly warfare for our souls, that our daily acts are sorted into virtues and vices of infinite consequence, and Bunyan's dream will again take hold of us with an interest that lies outside the domain and claims of literature. The conscience may thrill while the imagination sleeps. Until then we shall be rather in the position of the pilgrim in Hawthorne's "Celestial Railroad":

Not a great while ago (so that pleasant fable begins), passing through the gate of dreams, I visited that region of the earth in which lies the famous City of Destruction. It interested me much to learn that by the public spirit of some of the inhabitants, a railroad has recently been established between this populous and flourishing town and the Celestial City. Having a little time upon my hands, I resolved to gratify a liberal curiosity by making a trip thither. Accordingly, one fine morn-

ing, after paying my bill at the hotel, and directing the porter to stow my luggage behind a coach, I took my seat in the vehicle and set out for the stationhouse. It was my good fortune to enjoy the company of a gentleman—one Mr. Smooth-it-away—who, though he had never actually visited the Celestial City, yet seemed as well acquainted with its laws, customs, policy, and statistics as with those of the City of Destruction, of which he was a native townsman. Being, moreover, a director of the railroad corporation, and one of its largest stockholders, he had it in his power to give me all desirable information respecting that praiseworthy enterprise.

And so Mr. Smooth-it-away, as they speed along, points out how the road has been made safe. Apollyon drives the engine; over the old Slough of Despond a bridge has been thrown, supported on a foundation of suitable philosophy; Vanity Fair is a pleasant and salubrious town, in which passengers may stop over for a few days—and so on through a chapter of foolery worthy of Franklin for its wit, however its satire would have fallen pointless upon that magnificent and complacent citizen of the new world. He, like most of us to-day who are his children, would have felt more at his ease on that celestial railway with Mr. Smooth-it-away than with Christian and his comrades in the strait and narrow path; the *De te fabula* would have had no sting for him. It is true that the modern pilgrim had his qualms of doubt when he was carried headlong over the quaking pit and through the dark valley. P. E. M.

NEWS FOR BIBLIOPHILES.

The Bible, supposed to have been the property of John Milton, and sold by the Anderson Auction Company, New York, December 3, is now brought into question. It is a fine copy of the quarto Genevan, or "Breeches," version, printed by Christopher Barker, 1588. As described in the *Nation* of November 28, p. 490, it contains a slip pasted inside the cover, with the autograph signature and date, "John Milton, February 24, 1654." On the title of the New Testament is the autograph—"Elizabeth Milton"—Milton's third wife; and on the fly-leaf is her maiden name, "Elizabeth Minshull," together with signatures of several other members of her family. The book itself is genuine, but the signatures are doubted. So far as the history of this volume can be traced, it was in 1901 the property of an Alexander Howell of London. It was sold at Sotheby's, London, on February 25 of that year, for £225, to an agent of Dodd, Mead & Co., of this city. This firm in turn sold it—presumably at an advance—to William H. Buckler of Baltimore. In all these transactions there seems to have been no doubt as to the genuineness of the signatures. Indeed, in 1904, the volume was carefully examined by Dr. W. Aldis Wright, vice-master of Trinity College, Cambridge, who is thoroughly familiar with the autograph of Milton and is an authority on seventeenth-century literature. Dr. Wright expressed entire confidence in the genuineness of this relic. He wrote:

Apart from the signature I look upon the volume as a genuine Milton relic and a Bible belonging to his third wife, to whom he was not married until eight years after the date of his signature which has been inscribed in the book. Her autograph on the title page of the New Testament is very like her signature to the receipt which she gave Symonds in 1680 for the last payment in respect of the copyright of "Paradise Lost." It is something to have seen a Bible which has in all probability been in Milton's hands.

At the Anderson auction the Bible was knocked down for $1,225 to George H. Richmond, a bookseller of this city. A. J. Bowden, who is associated in business with Mr. Richmond, suspected the signatures on the fly-leaf, because the paper is apparently "woven" and not "laid"; and "woven" paper was not made until 1750. Scrutiny of the names under a microscope led him to think they have been traced; and in this opinion he is sustained by David N. Carvalho, an expert in handwriting. Mr. Carvalho believes all the names were written by the same hand.

At the Buckler sale at Anderson's, in this city, on December 3, prices ruled well, though there was not the competition which such a collection would have provoked a few months ago. The first edition of Higginson's "New-Englands Plantation," 1630, went for $520. A copy of the second edition, of same date, but printed from a different setting of type and containing six pages additional at the end, was bid up to £100 at the Sheffield sale, in London, last month. Lowell's "Commemoration Ode," 1865, a presentation copy to John Bartlett," sold for $420; the same copy brought $410 at the French sale in 1901. The copy of Shelley's "Prometheus Unbound," which he gave to Trelawney, with an inscription on title-page, brought $340, as against £101 at Sotheby's on December 7, 1904. Among the other prices are the following: Audubon's "Birds of America," original folio, with text, a good copy, $2,400; Beaumont and Fletcher's Works, 1647, first collected edition, $146; Burton's "Anatomy of Melancholy," first edition, 1621, $136; Dickens's "Pickwick Papers," 1837, the copy given by the author to W. C. Macready, $175; Goldsmith's "Vicar of Wakefield," 1766, first edition, $405; Morton's "New English Canaan," 1637, $300; Combe's "English Dance of Death," with colored plates by Rowlandson, in the original parts, $176; Shelley's "Alastor," 1816, $70; "The Cenci," 1819, $110; "Rosalind and Helen," 1819, $105; and Spencer's "Faerie Queene," 1590-96, $522.50.

At Hodgson's sale of November 21, in London, some valuable items of Americana went at low prices, owing, no doubt, to the lack of competitive bids from this side. The following prices were paid: Richard Eburne's "Plaine Path-Way to Plantations," 1624, a rare book with no previous auction record on a perfect copy, £70 only; Sir Robert Gordon's "Encouragements for such as shall have intention to be Undertakers in the New Plantation of Cape Briton, now New Galloway, in America," 1625, £140; Bullock's "Virginia Impartially Examined," 1649, £24; Hennepin's "New Discovery of a Vast Country in America," 1698, £13 15s.; Budd's "Good Order Established in Pennsylvania & New-Jersey in America," 1685, £101; Horsmanden's "Journal of the Proceedings," etc. (generally known as the "Negro Plot"), uncut, £51; Herrick's "Hesperides," 1648, a few headlines cut into, £48; Fielding's "Tom Jones," 1749, 6 vols., boards, uncut, but having the errata corrected, and therefore a second issue, £80; Gray's "Elegy," 1751, first edition, £104; Dickens's "Sketches by Boz," first octavo edition, 1837-1839, in the original parts, £65.

Correspondence.

A SUGGESTED STATUTE OF REASSURANCE.

To the Editor of The Nation:

Sir: I believe it would do much toward restoring business confidence if Congress would promptly pass a short statute merely providing that there should be no fine, imprisonment, or other penalty of a criminal or quasi-criminal nature under any of the statutes regulating commerce except upon sufficient proof that the law had been violated intentionally. Such is the established construction of the National Banking Act, which at least in this respect has been found satisfactory. While we are told that ignorance of law is no excuse, it is more to the point to say that the very essence of crime is a criminal intent, and a criminal conviction cannot be morally justified in the absence of intentional wrong. While the courts are not in entire harmony, most of them appear to hold that in prosecutions under the statutes regulating commerce actual innocence of intentional wrongdoing is no defence; and some of the courts, by excluding evidence of honesty of purpose, appear to hold that under these extraordinary statutes moral innocence is not even an extenuating circumstance. Rulings of this character have recently been made in several sensational suits. When to this is added the fact that no lawyer whose opinion is worth anything on any subject would now claim to have any clear idea of what is or what is not legal under these statutes, the dilemma of the ordinary layman seems hopeless indeed, unless his obscurity may protect him from the law's wrath.

This discreditable situation has produced or is producing several important results that can be clearly distinguished:

First, the confidence of the general investing public has been profoundly shocked. This is not a groundless panic. It rests upon a very real and sufficient foundation. However sound or solvent securities may be, judged by approved standards which until lately were deemed sufficient, there can be no assurance, as the law is now construed and administered, that they will not be utterly destroyed by confiscatory judgments rendered because of mere technical violations of incomprehensible statutes. We cannot rationally expect a permanent restoration of public confidence until this very real, grave, and wholly unnecessary danger is removed.

Second, this condition is already breeding a class of political lawyers, or lawyer politicians, who thrive politically and financially by taking either the offensive or defensive as the occasion may suggest in prosecutions under these statutes, and in arranging compromises to which alarmed business men submit in order to avoid the possibility of more serious consequences. This situation promises soon to ripen into public scandal, if that point has not already been reached.

Third, this situation tends to bring the entire criminal law into disrepute even

among law-abiding citizens. An indictment or conviction for violating the commercial laws no longer means disgrace or dishonor, and mere moral questions having become legally irrelevant are deemed practically immaterial. This catalogue of evil consequences could easily be extended without exaggeration. I cannot think of a single good result to offset them.

The much needed general revision of our statutes regulating commerce should not be hastily undertaken, but in advance of this revision the worst feature of these statutes should be promptly remedied by the measure above suggested, concerning the justice and necessity of which I see no room for rational difference of opinion.

W. J. MORONEY.

Dallas, Tex., November 23.

THE PANIC OF 1837 IN MISSISSIPPI.

TO THE EDITOR OF THE NATION:

SIR: Mr. F. C. Prescott's quotation from William Gilmore Simms, in the *Nation* for November 28, recalls to me another bit of testimony on the effect of the panic of 1837. In 1840 William H. Wills, of Edgecombe County, N. C., went to Mississippi to collect the debts due a North Carolina estate which he was settling. The following extract is from his journal of April 16, 1840:

I find through this county [Madison County, Miss.] some of the finest lands I have ever seen, & calculated to yield as much as any lands in the U. S. But alas! to such conditions are the people reduced in many affairs.—Speculation, speculation has been making poor men rich and rich men princes. . . . But as great as are the resources of Miss, and as valuable as are her lands, yet there were limits to both, and these limits have been passed, lost sight of & forgotten as things having no existence. A revulsion has taken place, Miss. is ruined, her rich men are poor and her poor men beggars. Millions on millions have been speculated on & gambled away by banking, by luxury, and too much prosperity, until of all the States in the Union she has become much the worst. We have hard times in No. Ca., hard times in the east, hard times everywhere, but Miss. exceeds them all. Some of the finest lands in Madison and Hinds Counties may now be bought for comparatively nothing. Those that once commanded from thirty to fifty dolls. per acre, may now be bought for three to five dollars and that with considerable improvements, while many have been sold at Sbffs. sales at fifty cents that were considered worth from ten to twenty dolls. Tbe people too are running their negroes to Texas & to Alabama, and leaving their real est. & perishable property to be sold or rather sacrificed. In the community where I am, it may probably be said that not one man in fifty are [*sic*] solvent & probably less a number tban this but what are more or less involved. So great is the panic and so dreadful the distress that there are a great many farms prepared to receive crops & some of them actually planted, & yet deserted, not a human being to be found upon them. I had prepared myself to see hard times here. but unlike most cases the actual condition of affairs is much worse than the report. The Society is dreadful, nothing like religion and indeed not much of common honesty. Still I am of opinion that the present and the next twelve months will be the most favorable times for those who ever think of migrating from the Northern & Eastern States. Lands are not only low, but I think a grand revolution must ensue. The dishonest and the insolvent must leave the State, when I think others will come in more prudent and prepared to act upon different principles from those who preceded them. . . . I had from $8 to $10,000 due in this State and find I shall not be able to collect *one single cent.* I met one man who offered to pay $3,000 in Union money, which could not be sold for more than 10c in the dollar. I had to decline receiving it. Finding it impossible to make any collections or of securing the debts due, I concluded it was useless for me longer to remain.

All of the journal from which this extract is taken is printed in the Publications of the Southern History Association, volumes VII. and VIII.

GEORGE S. WILLS.

Baltimore, Md., November 29.

PROF. E. S. MEANY'S "VANCOUVER."

TO THE EDITOR OF THE NATION:

SIR: I have only recently read Prof. E. S. Meany's interesting book, "Vancouver's Discovery of Puget Sound," which you reviewed on August 17. Professor Meany's interest in Vancouver is highly creditable, and the indifference of our own historians and geographers to the memory of that celebrated explorer appears by contrast in an unenviable light. Since Americans appreciate Vancouver and his work, you will perhaps permit me to offer some criticism of one or two points in Professor Meany's book.

First, let me direct attention to the mistake in the copy of the inscription on the memorial in Petersham Church, in the burial ground of which Vancouver's remains are interred. According to this copy, Vancouver performed "*twenty-five* years of laborious survey" in the North Pacific. The actual period, of course, is *five* years, as can be seen by reference to the photographic reproduction of the tablet. I should say that the error occurs in the book from which it is quoted, but surely the obvious inaccuracy of the time mentioned ought to have struck Professor Meany. Vancouver died at the age of forty.

Professor Meany mentions that Vancouver had a brother named John. He also had a brother named Charles, who must not be confounded with the Charles Vancouver who was an inspector under the first British Board of Agriculture, and was an American by birth. Vancouver also had two sisters—Sarah and Mary. Professor Meany, in commenting on the naming of two points at the entrance of Desolation Sound, Point Sarah and Point Mary, enters into some interesting but necessarily vague conjectures as to the origin of this nomenclature. No doubt he will agree that the natural explanation is that the two points were named by Vancouver after his sisters.

W. H. HARLAND.

Ham Common, Surrey, England, November 20.

TRINITY COLLEGE AND WESLEYAN.

TO THE EDITOR OF THE NATION:

SIR: In an editorial December 5 you say, "Trinity is, we believe, tied to the Episcopal Church, and Wesleyan to the Methodist." You do Trinity College an injustice by this statement, and very probably an injury, which I am sure you will be quick to amend, so far as your *vox missa* can be recalled. Will you kindly note that the original charter of Trinity College, which is still in force, reads:

Provided always, that such ordinances or by-laws shall not make the religious tenets of any person a condition of admission to any privilege in the said college, and that no president or professor or other officer shall be made ineligible for or by reason of any religious tenet that he may profess, or be compelled, by any by-law or otherwise, to subscribe to any religious test whatsoever.

It may be interesting to note that only a small minority of the faculty, and a considerable minority of the students, are Episcopalians. In no way is the college "tied to the Episcopal Church." Trinity is, and has been, true to the spirit as well as to the letter of her broad-minded charter.

You might also note that Wesleyan University is no longer "tied to the Methodist Church." Her charter was changed last spring by the Connecticut Legislature, at the request of her board of trustees; and although it does not, as the Trinity charter does, prohibit religious and ecclesiastical tests, it no longer directly imposes any.

ELMER TRUESDELL MERRILL.

Trinity College, Hartford, Conn., December 6.

Notes.

Scribner's announce a definitive reissue of "The Novels and Tales of Henry James," in twenty-three volumes, to be called the New York edition. This will contain all the fiction that Mr. James thinks worthy of preserving. All the works, particularly the early ones, have been scrupulously revised by the author, who has also provided prefaces narrating the circumstances under which the stories were conceived and executed, and to a certain extent interpreting them.

Early in the New Year the Macmillan Company will publish a work on "Modern Egypt" by the Earl of Cromer.

E. P. Dutton & Co. publish this week "Vasari on Technique," translated from the "Vite" by Louisa S. Maclehose; and "The Growth of English."

The issue of the *Harvard Graduates' Magazine* for December contains a portrait of Prof. Charles Eliot Norton, a sonnet addressed to him by Mrs. Edith Wharton, and letters and articles on his work by Ambassador Bryce, President Eliot, Dr. Horace Howard Furness, Richard Watson Gilder, Col. Thomas Wentworth Higginson, William Dean Howells, Professors George Herbert Palmer, Bliss Perry, and Goldwin Smith, and Andrew D. White.

William Raimond Baird has compiled and publishes himself "The Handbook of Beta Theta Pi," now in its second edition, as authorized by the convention of 1906.

"How to Collect Postage Stamps," by Bertram T. K. Smith, has been published in London by George Bell & Sons and in this country by the Macmillan Co. The volume is excellently printed and amply illustrated by photographic reproductions of rare stamps; it contains a bibliography and index. Another work in the same field is the first volume of "Postage Stamps and Their Collection," by Warren H. Colson, published in Boston by the author. He plans a series of handbooks describing the great collectors and collections of the world. This first issue, with an introduction by F. Apthorp Foster, describes the stamps of Dr. W. C. Bowers of Bridgeport,

Conn. The press work is unusually good, and there are many photographie fac-similes.

In his "Heresy of Job" (New York: John Lane Co.) Francis Coutts has made an interesting arrangement of the text of that ancient book, in the manner so much in fashion nowadays, as in the "Modern Reader's Bible," with the aim not merely of bringing out the literary value of the poem, but also of showing the direction and force of the argument. In this purpose he has relegated the "harangue" of Elihu the Buzite to an appendix as an interpolation, and has divided the remaining matter into a "prologue," a "debate," and an "epilogue," at the same time separating the speeches, naming the speakers, and spacing their lines in accordance with his notion of their poetic significance. His general idea, too, of the meaning of the poem he has reinforced by an introduction and a preface, wherein he justifics his title and conception. Job he conceives to be a heretic because he refuses to accept the teaching of religion as final, or, indeed, to profess any dogma in which he is unable to believe, but insists upon wrestling directly with God for His blessing; so that the book as a whole becomes something more than "a fine exposition of the mystery of sin and suffering"—or a primitive discussion of the data of tragedy, to which Renan would pretty nearly reduce it. To these particulars not a little interest is added by the excellent reproductions of Blake's original illustrations or "inventions," which, it must be confessed, assort a little incongruously with all this typography, wide margins, bright blue binding, and paper label.

On November 28, 1767, Horace Walpole wrote:

> It occurred to me some years ago that the picture of Richard the Third, as drawn by historians, was a character formed by prejudice and invention.

To the body of literature which begins with this conjecture Sir Clements Markham has recently added the most important title, "Richard III.: His Life and Character" (E. P. Dutton & Co.). It will be remembered that as long ago as 1891 he published in the *English Historical Review* a vindication of Richard which was at the same time an attack on Henry VII. And from Walpole's time till now all admirers of Richard have been forced to heap obloquy upon Henry. Either that tradition which so long held the field, and which still claims the support of James Gairdner, is sound, or the court historians who flourished under Henry VII. deliberately set out, at the instance of their master, to construct a myth. According to the anti-Tudor theory, Archbishop Morton is the chief offender among these party pamphleteers, with Polydore Vergil, Rous, and Fabyan engaged in close competition for second place. "It is easy to perceive," says Walpole, "under all the glare of encomiums which historians have heaped on the wisdom of Henry the Seventh, that he was a mean and unfeeling tyrant. I suspected that they had blackened his rival, till Henry, by contrast, should appear in a kind of amiable light." Likewise Sir Clements Markham:

> He was essentially un-English. He was a near relative of Louis XI., and he made that mean tyrant his model. He hated English freedom, and that intimate contact with the people which made the Plantagenets popular. . . . He was penurious, greedy, and mean. . . . He was very superstitious. When his own interests were not concerned he was not devoid of natural affection, and he recoiled from crime. Yet he became capable of any foul deed if he deemed it necessary for his own security.

With the arguments in this case all historians are by this time fully familiar, and we shall not debate the evidence. At the present moment it is Sir Clements Markham versus James Gairdner. The present volume makes a distinct advance on the article in the *English Historical Review*, but it is not wholly convincing. The author seems to think it impossible that a ruler with the political virtues which nowadays are pretty freely credited to Richard should at times have been guilty of crime. He is also over fond of exclamation points and the mood which accompanies them.

The Roman Journals of Ferdinand Gregorovius, 1852-1874, edited by Friedrich Althaus, and translated from the second German edition by Mrs. Gustavus W. Hamilton, have been published by the Macmillan Company. These journals, first issued in German fifteen years ago, are already as nearly classic as any work of such recent date can be. Their general qualities are too well known to require description here. We only wonder that English readers should have had to wait so long for a translation of a book which has made the tour of Continental Europe. Gregorovius went to Italy in 1852 at the age of thirty-one. Not long afterward, he conceived the idea of writing the history of the city of Rome—an uudertaking which kept him in Italy until 1874. During this period, he not only came to know the best Italian society intimately, but also the cosmopolitan throng of celebrities who visited the Eternal City from season to season. So his journals have a threefold interest. First, they enable us to trace his progress on his history, and, incideutally, to get an insight into his sturdy character. Next, they throw very important side-lights on Italian and Papal politics in the last years of the Papal dominion. Finally, they give many characteristic sketches of the distinguished statesmen, authors and painters whom Gregorovius met. He took his responsibility as historian seriously, and carried out his work with that thoroughness which used to be regarded as an exclusively German quality. But he was much more than the typical German, or Germanized, pedant. He was a poet; a romancer; a writer of *Reisebilder* which still, after fifty years, keep their charm; a lover of classical literature; an enthusiast for liberty. The entries in his diary, often brief, are like the thumbnail portraits or landscapes or memoranda which the etcher jots along the margin of his plate. You can open the book anywhere and be sure to find entertainment; for the student of history, there are many invaluable notes; for the observer of social life there are the most varied sketches, and even gossip.

"Tsze tèn piao mŭh: A Guide to the Dictionary," an essay "exhibiting the 214 Radicals of the Chinese written language, arranged according to the mnemonic system of William Stokes," by Thomas Jenner, member of the China Society, is issued in a second edition by Luzac & Co. of London. The gist of the work is the application of the mnemonic system of William Stokes to a number of objects of study connected with the Far East. The 214 Radicals, which serve as keys to the thousands of characters forming the Chinese written language, are indeed a crux to the memory of most Western students; but it seems a matter of taste and individual inclination whether just this, or indeed any other artificial help to the memory, will render the study less difficult than it is otherwise. Whoever wishes to become proficient in the reading, or as we ought to call it, deciphering, of a Chinese book, must build up a memory *ad hoc*. At the very first a student will think it next to impossible to retain in his memory merely as many as half a dozen of those signs of which, in order to become an efficient reader, or "decipherer," he is expected to learn as many thousands. But he will soon find that his faculty of remembering characters increases like an avalanche. This avalanche, however, absorbs all his mnemonic powers, occupies all the chambers of his brain, and leaves but little room for remembering certain other useful things, such as the faces and names of his friends or the identical hat, umbrella, or pair of rubbers which is his. Nevertheless, the creation of a special memory for ideograms is as much a *sine qua non* of success to the would-be Chinese reader as the faculty to remember his parts is to an actor. Mnemonics are merely a substitute for the genuine article, a good memory; they act like narcotics, which will produce sleep, but spoil the faculty of sleep the more we become addicted to their use. Mr. Jenner applies the mnemonic system not only to the Chinese Radicals, but also to Chinese chronology, and names of dynasties and Emperors from Yü down to Kuang-sü, the present sovereign. The following matters are also treated, or maltreated: the names of the eighteen provinces and the principal cities of China, the Japanese Hiragana and Katagana syllabary, the Emperors and the geography of Japan.

The occasional addresses of the Rev. Charles Edward Jefferson in the volume "The New Crusade" (Thomas Y. Crowell & Co.) reveal a man of intense moral conviction and the faculty of putting needed truth in effective form. The crusade which he preaches is that of individual redemption in an age mad after social improvement. As members of the crusading army he seeks "consecrated personalities," great men, devoted to truth and righteousness. Religion he conceives as "a form of power." His subjects are varied, but the underlying thought is the need of larger and nobler manhood rather than of multiplied laws and more highly developed institutions. His exposition of Christian Science, its source of strength, its limitations, and its message to spiritual leaders, is especially discerning.

The Kirchliches Jahrbuch, edited by Pastor J. Schneider, and published by C. Bertelsmann, Gütersloh, has appeared for the current year as the thirty-fourth volume of the series. Students wishing for the latest and most complete data on any particular of German church organization or work, will find here official statistics, intelligently arranged, and carefully digested. The

different departments are in the hands of specialists. The Jahrbuch contains among other things a full list of the church authorities, and the new church laws of the past twelve months.

Of the "Realencyklopaedie für protestantische Theologie und Kirche," begun by J. J. Herzog, but now being edited in its third edition by Prof. Albert Hauck, the historian in the Leipzig theological faculty, the nineteenth volume, reaching from Stephen to Tonsur, has just been published by the house of Hinrichs, Leipzig.

A compact, but clearly written book of 231 pages, entitled "Soziologie: Positive Lehre von den menschlichen Wechselbeziehungen," by Ratzenhofer, has just been published by F. A. Brockhaus, in Leipzig. Ratzenhofer, who died in 1904, in the sixty-second year of his age, was an officer in the Austrian army, from which he retired after attaining the rank of lieutenant-field-marshal in 1898. In addition to several works on military affairs he published during the last ten years of his life a number of volumes on ethical, economical, social and political problems, one of which, "Positive Ethik," was favorably noticed some years ago in these columns. The present treatise was found among his posthumous papers, and has been edited with occasional annotations by his son. The book may be characterized as a comprehensive summary of Ratzenhofer's former investigations, including important features and functions of social evolution, the origin of social aspirations and impulses and their realization in individual life and human institutions. The author emphasizes the immense significance of the family as a mirror of society and a means of promoting civilization through the development and transmission of desirable personal characteristics. Of special interest at the present time are the views of the author, as a military man of high rank and acknowledged capacity, on the question of disarmament. He approves of the proposal to reduce armaments not only in the interests of peace and the industrial progress and general prosperity of the nation, but also as the best means of increasing the efficiency of the army. Many States, he says, have gone to excess in applying the principle of universal military service, and in this respect Germany is the chief delinquent. Every mobilization fills the hospitals with physically incompetent recruits, who, if not compelled to enlist, would devote themselves to peaceful pursuits and thus increase the wealth and further the material welfare of the nation. The only remedy for this evil is the reduction of the size of the army by raising the standard of martial competency, a measure which would contribute to the economical advancement and general prosperity of the country.

Since the publication of W. G. Aston's "History of Japanese Literature" (London, 1899) and Tomitsu Okasaki's "Geschichte der japanischen National-literatur" (Leipzig, 1899), European scholars have devoted themselves with peculiar ardor to the study of this subject, and one of the most valuable results of these researches is Dr. Karl Florenz's "Geschichte der japanischen Literatur," just issued by Amelung in Leipzig. The author, a German, has held for eight years a professorship of German literature and comparative philology in the Imperial University at Tokio, and has taken advantage of this position to acquire a thorough knowledge of Oriental culture, especially as reflected in the intellectual development and literary productivity of the Japanese. In the work before us he gives a comprehensive historical and critical survey of these national characteristics and achievements from the earliest times to the present day, concluding with an account of the revival and transformation of the national prose and poetry under European influences during the last quarter of a century. In 1882, three Japanese scholars published a volume entitled "Shintaishi-Sho" (Poems in New Style), consisting chiefly of translations from the English, such as Gray's "Elegy in a Country Churchyard," Longfellow's "Psalm of Life," and some of the odes and idylls of Tennyson. Professor Florenz draws some striking parallels between Japanese novelists and their European compeers and contemporaries, from 1642 to 1842; of these examples we will mention only the comparison of Kyoden with Samuel Richardson, Bakin with Goethe, Ryutei Tanehiko with Walter Scott, and Tamenaga Shunsui with Dumas. Indeed the Japanese novel has passed through all the phases of European fiction and reached its climax during the first half of the nineteenth century. Owing to strong prejudice against the stage and a prevalent feeling of contempt for actors, the drama has hitherto held an inferior place in Japanese literature, and although quite recently a marked improvement has been made in this respect, our author asserts that "centuries will elapse before the Japanese shall have reached the same stage of development as the Europeans in the province of the drama," an opinion confirmed and, in fact, first expressed by the Japanese critic Tsuhouchi, in an essay, "Wagner and the Music-Drama," published in 1904. As yet the enthusiastic efforts of this Oriental Wagnerite to introduce the operas of the great German composer have proved unavailing, owing to the desultory and frivolous character of Japanese music as an accompaniment to the dance.

An abundance of new and interesting details are found in the report of the German expedition to Abyssinia, published by Felix Rosen, under the title "Eine deutsche Gesandschaft in Abyssinien," with 160 illustrations and a map (Leipzig: Veit & Co.). It is nearly three years since Dr. Rosen headed this expedition to the Negus Negesti of Ethiopia, bringing him the gifts of the German Emperor and succeeding in the establishment of a commercial treaty. It is particularly the student of natural history and of the customs of this historic people who will profit by the perusal of this volume. The author aims chiefly, as he himself states, to give the *Reiseeindrücke eines Naturforschers*, and the whole is characterized by a simple and straightforward account of what the author saw and heard.

"The Future of Austria-Hungary and the Attitude of the Great Powers," by "Scotus Viator," published a few months ago by Archibald Constable & Co., London, has been translated by Elsa Brockhausen, and appears with a special introduction by Prof. C. Brockhausen, under the title "Die Zukunft Oesterreich-Ungarns und die Haltung der Grossmächte" (Vienna: Franz Densicke), Professor Brockhausen, who is a member of the law faculty in the University of Vienna, declares that the author of this work is one of the very few outsiders who understand the political status in Austro-Hungary, and hence knows why the preservation of the dual monarchy *in statu quo* is a vital necessity to the peace of Europe. Pan-Germanism he declares to be folly. Professor Brockhausen's purpose, in part at least, in bringing out this translation, is to give his compatriots, especially the Magyars, the views of an intelligent and thorough foreign student of Austrian affairs.

"The wish to make the Swedish poet I like best known by people of the nations I like best" is given as the reason why A. W. Björck, a former resident of this country, has translated into English a few of the poems of Gustaf Fröding, one of the most original as well as one of the most popular of modern Swedish poets (Stockholm: Björck & Börjesson).

Eugène Revillout, curator of the Egyptian collections of the Louvre Museum, publishes the third volume of "L'Ancienne Égypte d'après les papyrus et les monuments." It comprises 167 pages, continuing the subject of woman in Egyptian antiquity. Jean Capart, curator of Egyptian antiquities of the Royal Museum, Belgium, continues his publications by two quarto volumes (one text, one of 117 plates) entirely devoted to "Une Rue de tombeaux à Saqqarah." The excavations of this street, "the corner of an Egyptian Pompeii," were made from 1807 to 1899, by Prof. Victor Loret of the University of Lyons. Two other *savants* of Lyons, Dr. Lortet of the Faculty of Medicine (not to be confounded with Professor Loret), and C. Gaillard, curator of the Natural History Museum, publish 110 pages of text, with 66 illustrations, on "La Faune momifiée de l'ancienne Égypte et recherches anthropologiques."

H. Pognon, French consul, begins at the Imprimerie Nationale the important publication of the Semitic Inscriptions of Syria, Mesopotamia and the region of Mossûl. The first part, a quarto volume, contains 42 inset plates. The second part will appear in 1908. The price of the two (which are not sold separately) is 60 francs.

The new and first really substantial fragments of Menander, which have excited great interest from the description of Professor Croiset, have been published in plates from the original papyrus (ed. Lefebvre) at the price of 25 francs.

The third volume of the unique "Sources inédites de l'histoire du Maroc," by Count Henry de Castries, has appeared in Paris.

The first volume of the "Catalogo dos Livros sobre o Brasil," by J. C. Rodrigues, comprising the titles and indications of 2,646 separate works, and covering the entire colonial period (1492-1822) has appeared in Paris. Only 200 copies have been printed, of which only 15 are to be sold at the price of 130 francs. The importance of such bibliography to students working

in so imperfectly cultivated a field as South American history may easily he seen. The book may he obtained also from Bernard Quaritch, of London.

The Rhodes scholars, according to the report just issued of the Trustees of the Fund, are doing credit to themselves and the countries from which they come. Eight "Firsts" were won by them during the past year, and they received several of the principal university distinctions. Out of the one hundred and sixty now in residence, twenty-four are reading for Classical Honors, eighteen for history, and ten for theology. Jurisprudence, however, attracts the greatest numher, thirty.

The Archæological Institute of America and the American Philological Association will meet at the University of Chicago, Decemher 26 to 30. The managing committees of the American School of Classical Studies in Rome and of the American School of Oriental Study and Research in Palestine will hold their meetings in conjunction with this gathering. At the sessions of the Institute and the Association papers will he read or presented hy Paul Shorey, Frank B. Tarbell, John M. Manly, and Frank Frost Abbott of the University of Chicago; Maurice Bloomfield, Kirby F. Smith, Wilfred P. Mustard, Harry L. Wilson, and David M. Robinson, Johns Hopkins; J. E. Harry and George H. Allen, University of Cincinnati; Hamilton Ford Allen, University of Illinois; Roy C. Flickinger and John Adams Scott, Northwestern University; George Depue Hadzits, University of Pennsylvania; Arthur Fairbanks, director of the Boston Museum of Fine Arts; Caroline L. Ransom, Bryn Mawr; George H. Chase, David G. Lyon, George F. Moore, Julius Goehel, and Arthur Stanley Pease, Harvard; Joseph Clark Hoppin, Washington, D. C.; Alfred Emerson, Art Institute of Chicago; Thomas Day Seymour and P. V. C. Baur, Yale; Francis W. Kelsey, Camphell Bonner, and Henry A. Saunders, University of Michigan; D. G. Hogarth, director of the Cretan Exploration Fund; James M. Paton, Cambridge, Mass.; Edgar L. Hewett, director of American Antiquities; Charles H. Weller, State University of Iowa; Herhert C. Elmer, Cornell; Thomas Fitz-Hugh, University of Virginia; Curtis C. Bushnell, Syracuse University; W. S. Scarborough, Wilberforce University; Arthur L. Frothingham, Princeton, N. J.; La Rue Van Hook, Princeton University; Herbert C. Tolman, Vanderhilt University; Jesse Benedict Carter and Esther B. Van Deman, American School of Classical Studies in Rome; and Arthur S. Cooley, Auhurndale, Mass.

The programme for the Fourth Annual Meeting of the American Political Science Association, to he held at Madison, Wis., Decemher 27-31, includes papers and addresses by Frederick N. Judson, St. Louis; Leo S. Rowe, University of Pennsylvania; John Barrett, director of the Bureau of American Repuhlics; William R. Shepherd, Columbia University; Hiram Bingham, Yale; Bernard Moses, University of California; J. Allen Smith, University of Washington; George H. Haynes, Worcester Polytechnic Institute; James W. Garner, University of Illinois; Jesse Macy, Iowa College; Thomas F. Moran, Purdue University; Charles E. Merriam, Ernest Freund, and Floyd R. Mechem, University of Chicago; Benjamin F. Shambaugh, University of Iowa; W. S. U'Ren, Speaker of the Oregon Assemhly; George A. Thacher, Portland, Ore.; W. B. Munro, Harvard; Cephas D. Allin, University of Minnesota; Charles McCarthy, legislative lihrarian of Wisconsin; John Whitehead, State Senator of Wisconsin; John Bell Sanhorn, Madison; Herman E. Ekern, Speaker of the Wisconsin Assemhly; E. A. Gilmore, University of Wisconsin; Clarencc B. Lester, legislative lihrarian of Indiana; Frank M. Hoyt, Milwaukee; Roscoe Pound, Northwestern University; James E. Bahb, president of the Idaho Supreme Court Building Commission; Horace E. Deemer, justice of the Supreme Court of Iowa; Samuel J. Barrows, secretary of the Prison Association of New York; Francis E. McGovern, district attorney of Milwaukee; and Rudolf Leonhard, University of Breslau.

The annual report of the Osaka Library, Japan, is a record of remarkahle activity, and reflects conditions of popular use much like those prevailing in American cities. The lihrary has a total of 53,845 volumes, of which 48,507 are Japanese and Chinese and 5,338 in various European languages. The circulation for the year was 372,845 volumes, 16,554 of which were foreign. These figures show that the entire stock of the lihrary was turned over an average of seven times during the year, a record that few American libraries of any size can equal. According to the classified tahle of Chinese and Japanese books, there are under literature, 8,644 volumes; history, 7,733; general works, 7,445; philosophy, 3,629; useful and fine arts, 2,338, philology, 1,723; religion, 1,282. Of the total circulation, 92,427 volumes were in philology and literature, 50,-711 in the arts 35,872 in history and allied suhjects. To an American lihrarian, the striking thing is the relatively large supply of hooks in philosophy and philology, and the large circulation of books in the arts. The classification of visitors to the lihrary shows that of the total, numhering 105,237 persons, 3,308 were women, 15,167 husiness men, 1,574 government officials, and 45,600 students.

The National Literary Society of Dublin has issued a final appeal for money to complete the Clarence Mangan Memorial. Only £30 is now lacking. The memorial, the work of the sculptor Oliver Sheppard, will he ready this month.

Edward Manning Ruttenber, a local historian, died at Newhurgh December 5. He was horn in Bennington, Vt., in 1825, and he was in journalism hoth in Newhurgh and Goshen. From 1863 to 1865 he was connected with the Bureau of Military Records at Alhany. He was author of "History of Newhurgh," 1859; "History of Regimental Flags," 1865; "History of Ohstructions to Navigation of the Hudson River, 1776"; "History of the Indian Trihes of the Hudson River," "History of Orange County," 1881; and numerous other monographs.

The death is announced, in his seventy-fourth year, of Prof. Karl Ruland, director of the Grandducal Museum in Weimar, one of the founders of the Goethe Society, and director of the Goethe National Museum He wrote largely on Goethe and other literary topics.

Prof. Adolf Kressner of Cassel has died at the age of fifty-four. He has to his credit a long list of works on philological suhjects, chiefly of the Romance languages; among them: "Grundriss der französischen Literatur," "Geschichte der provenzalischen und französischen Literatur," "Rustehuef," and "Antologia de Poesia Española."

Carlotta Ferrari has just died in Bologna at the age of sixty-seven. She was hoth musician and poetess. She wrote two operas "Ugo" and "Eleonora d'Arhorea," hut was hest known for her poem, in ten cantos, on "Dante Alighieri."

NOTES ON HOLIDAY BOOKS.

In his "English Socicty of the Eighteenth Century in Contemporary Art" (E. P. Dutton & Co.), Randall Davies has made what may be called a happy *vade mecum* for readers of the novels and letters of the period. It is not an erudite hook; the sources drawn on for the text are chiefly such familiar authors as Swift, Walpole, Miss Burney, Goldsmith, and De Saussure—and are the more interesting for this. More diligence was required to get together the illustrations, taken in part from the well-known pictures of Hogarth, Reynolds, and Zoffany, hut in large measure also from engravings now in private possession, and not easily got at. The charm of the hook lies in the parallel reproduction of eighteenth century life in text and illustration; in reading, for instance, a page about Vauxhall from "Evelina," with Mr. Davies's account of that famous garden, and in having hefore the eye at the same time a good reproduction of T. Rowlandson's engraving. The pictures take a pretty wide range of satire and sentiment.

For artistic and literary traveller alike, the cathedrals and châteaux of France are an inexhaustihle field, and every year at this season we have a group of hooks exploiting the suhject. This year Francis Miltoun, the most industrious cultivator of the ground, takes up the "Castles and Châteaux of Old Navarre, and the Basque Provinces" (L. C. Page & Co.). Mr. Miltoun's method as a traveller is now so well known as scarcely to need characterization here. The hook is tastefully printed, with illustrations from paintings, "made on the spot," hy Blanche McManus. Another series continued is hy Elise Whitlock Rose, with illustrations from original photographs hy Vida Hunt Francis. This season their suhject is "Cathedrals and Cloisters of Midland France" (2 vols., G. P. Putnam's Sons). History, architectural description, and anecdote are wrought together as in most hooks of the sort. The illustrations are numerous, and give hoth general and detailed views of the huildings. A third work is of somewhat different character. As the result of notes taken down during five summers spent together in France, Herhert Marshall and Hester Marshall have written their "Cathedral Cities of France" (Dodd, Mead & Co.), to which the first-named collaborator has added sixty illustrations in color. The writing is simple and dignified; the pictures are in some cases clear and attractive, hut in others show that hlotchy, messy surface which is still the hane of most color printing.

In his "Nooks and Corners of Old England" (Charles Scrihner's Sons), Allan Fea records, in the genial topographical manner with which countless books of this type

have made us familiar, his visits to a number of manor houses and churches that lie out of the path of the tourist, but are quite as interesting in their way as the show places. These nooks he makes known by a series of charming photographs, accompanied by lively descriptions of local superstitions and rural customs. In these backwaters of English life, the influence of the board school and the factory and the decline of agriculture are little felt and the old ways are kept up with spirit. When a young girl dies, a "virgin's crown" of thin wood covered with paper and decorated with black and white rosettes with paper gloves hung in the middle, is still carried before the coffin and placed high on the wall inside the church. In a little village in northern Derbyshire, the villagers still make offerings of flowers at the wells and springs on Holy Thursday, a custom that dates from the time of Nero. Mr. Fea has a large store of curious information. At Erwarton, where Anne Boleyn's heart was buried, according to her desire, he is reminded of the fate of the heart of Louis XIV., which is so extraordinary that we repeat it here. An ancestor of Sir William Harcourt was presented with the heart by a French canon who had saved it from the mob when the tomb was rifled during the Revolution. Many years after, Buckland, the Dean of Westminster, was shown the relic by the Harcourts, and whether by design or accident, "before he could be stopped he put the heart in his mouth and swallowed it. Very shortly afterwards he died and was buried in Westminster Abbey. It is impossible that he should ever have digested the thing. It must have been a pretty tough organ to start with, and age had almost petrified it. Consequently the heart of Louis XIV. must now be reposing in Westminster Abbey in the body of an English Dean." This rivals the adventures of the heart of the great Montrose which was enclosed in a steel case, found its way into a collection of curios in Holland, was recovered by the descendants of Montrose and taken to Madeira. There it was stolen and sold as a charm to an Indian chief. Recovered once more and taken back to Europe, it was deposited temporarily with a lady at Boulogne, who hid it in a safe place and promptly died, leaving no clue, so that the Napiers still lament the heirloom, though they do not despair of its recovery. Evidence of the indiscriminate hospitality of the old English squire is to be seen in more than one English manor house where the common road led right through the great hall of the house, and all who passed by were warmed and fed. Mr. Fea is an expert in secret chambers and hiding places, especially those used by Royalists and by priests at the time of the persecution of Catholics.

In "A Tuscan Childhood" (The Century Co.) Miss Lisi Cipriani makes a real contribution to books on child life. She tells how a large family of children were brought up, chiefly in the country, thirty years ago in Tuscany. German and English governesses, the peasant retinue indoors and out, the conscientiously strict mamma, the austere, matter-of-fact father, and the children themselves, full of mischief and emotions, are pictured sympathetically, but without mincing words. There are many humorous episodes—as when Lisi herself fell into the water—and some pathetic ones—as when the superstitious Teresa was terrorized by the cat. The book is intended for grown-up readers, but the young will enjoy many parts of it.

A reprint of Erasmus's "Against War," by the Merrymount Press, Boston, would be justified merely by the exquisite typography. The font selected is clear and pleasing, most grateful to the eye in reading; and the page is comely. J. W. Mackail writes the introduction, in which he points out how this treatise grew, with Erasmus, as the fire burned, from small beginnings to these full proportions. The translation followed is that of the earliest English version, published originally by the King's printer. Mr. Mackail sees an aptness in this reissue, at a time when a new glorification of war is afflicting the nation. Erasmus does not exactly "ingeminate peace with Falkland," but he does set forth war in its true colors, as a thing repugnant to humanity and the very denial of the Christian faith.

Though Welsh folklore has had a good deal of attention from Sir John Rhŷs and others, up to this present no collection has appeared of Welsh tales arranged for the use of children. With this branch of legends the younger generation, even in Wales itself, has had but little opportunity of becoming familiar. This want bids fair to be supplied by W. Jenkyn Thomas's "Welsh Fairy Book" (London: T. Fisher Unwin). Students of Celtic folklore will not be surprised to find that in this dainty volume a large part is played by the "Tylwyth Teg," or "little people," and the lake maidens. Many of the most attractive stories, "The Curse of Pantannas," "The Lady of the Lake," the "Llanfabon Changeling," the "Fairy Wife," etc., centre round them. It is noteworthy that while in some cases it has been necessary to piece scraps together, nothing has been inserted that is not traditional. The book has been charmingly illustrated by Willy Pogany, and should form a welcome addition to the Christmas gift-books.

Among the reprints of poetry specially prepared for Christmas gifts is Palgrave's "Golden Treasury," illustrated in color and line by Robert Anning Bell. It is published by J. M. Dent & Co. in England and E. P. Dutton & Co. in this country. Dutton also issues Longfellow's "Evangeline," with illustrations in color by Arthur Dixon; and Macaulay's "Lays of Ancient Rome," illustrated by Paul Hardy. Houghton, Mifflin & Co. have an edition of "The Hanging of the Crane," with illustrations in color by Arthur I. Keller; and John W. Luce, Boston, Longfellow's "Wooing of Hiawatha," on paper and in binding to imitate birch-bark. George Wither's "Christmas Carroll," with pictures and text drawn by Frank J. Merrill, comes from the press of G. P. Putnam's Sons. Sidney Lanier's "Hymns of the Marshes" is "illustrated from nature" by Henry Troth, and published by Charles Scribner's Sons.

Standard fiction is represented by Jane Austen's "Pride and Prejudice," with twenty-four colored illustrations by C. E. Brock, and Dickens's "Haunted Man" and "Battle of Life," with pictures by the same artist. All three of these volumes come from E. P. Dutton & Co. T. Y. Crowell & Co. adds Reade's "The Cloister and the Hearth" in thin paper and limp leather. "Alice's Adventures in Wonderland," with illustrations by Arthur Rackham—fantastic and on the whole successful, though not Tenniel—is published by Doubleday, Page & Co. A. C. McClurg & Co. offer "Immensee," translated from the German of Theodore Storm by George P. Upton. The volume is prettily illustrated and decorated by Margaret and Helen Maitland Armstrong. Under standard fiction we may also class one of the most beautiful books of the season, "The Ingoldsby Legends," illustrated by Arthur Rackham. In 1898 Dent & Co. of London published the "Legends" with about one hundred pictures by Mr. Rackham, to whose talent the task of illustrating such a work of fantasy is peculiarly congenial. Many of these drawings have been worked over and reproduced on a larger scale, a number of new drawings (in black and white and in color) have been made, and the text has been revised and reset in a large, clear type. The publishers (E. P. Dutton & Co., in this country) now offer the volume as an "edition définitive de luxe" of a favorite classic.

The market is, as usual, abundantly supplied with Christmas booklets, for the most part attractive reprints of standard works. The Century Company gives us in its Thumb-Nail Series Dickens's "Seven Poor Travellers" and "The Holly Tree," Stevenson's "Travels with a Donkey," and Longfellow's "Tales of a Wayside Inn." Paul Elder & Co.'s Abbey Classics include such books as Lowell's "Vision of Sir Launfal," Burns's "Cotter's Saturday Night," Milton's "Ode on the Morning of Christ's Nativity," and Longfellow's "Building of the Ship." The same firm prints "The Sea Fogs" from Robert Louis Stevenson's "Silverado Squatters," with an introduction by Thomas Rutherford Bacon. Houghton, Mifflin & Co. issue Hood's "Faithless Nelly Gray," with amusing illustrations, after the manner of old woodcuts, by Robert Seaver; Mitchell Kennerley of New York, Solomon's "Song of Songs," FitzGerald's "Rubáiyát of Omar Khayyám," "Early Poems of Dante Gabriel Rosetti," Vernon Lee's "Sister Benvenuta," and A. E. Housman's "Shropshire Ladd"; T. Y. Crowell & Co., in the Handy Volume Classics, "Best American Tales," edited by W. P. Trent; "Little Flowers of St. Francis," translated by W. Heywood; Long's translation of the "Meditations" of Marcus Aurelius, Drummond's "Natural Law in the Spiritual World," Thoreau's "Cape Cod," and Sir Thomas Browne's "Religio Medici." The same firm gets out in a white binding Henry van Dyke's "Battle of Life" and "The Good Old Way," Johanna Pirscher's "Growth without End," Annie Payson Call's "Heart of Good Health," and J. R. Miller's "Glimpses of the Heavenly Life." Duffield & Co. offer Lincoln's Gettysburg address, and his first and second Inaugural Addresses, Washington's Farewell Address, the Declaration of Independence, the Constitution of the United States, FitzGerald's "Rubáiyát of Omar Khayyám," and St. Francis of Assisi's "Canticle of the Sun"; H. M. Caldwell Co., Whittier's "Snow Bound," and Oscar Wilde's "Salome."

CURRENT FICTION.

Wards of Liberty. By Myra Kelly. New York: The McClure Co.

Miss Kelly (Mrs. MacNaughton) has had the good fortune to strike a fresh vein in fiction. The miraculously rapid process by which America is able to absorb and assimilate the unpromising material thrust upon her by the Old World is a process which most of us must accept as a fact without having personal knowledge of its stages. Miss Kelly's experience of the New York primary school of the East Side gave her such knowledge; and she had the wit and sympathy to convey it to the restless magazine public in most palatable form. The children of the Ghetto and the sweat-shop, with whom she had principally to deal, represented the problem at its most difficult point. Often the parents had no English, and retained, besides the stubborn prepossessions of their race, the habits of the vile European dens from which they had escaped or been flung. The first moment of contact between the small, piteous alien of the Jewish quarter and American life is Miss Kelly's opportunity; and her Eva Gonorowsky and Morris Mogilewsky are no doubt as well known to the myriad readers of the illustrated magazine as the leader of Christian Science or the head of the Standard Oil Trust. They are really humorous creations, both funny and pathetic; Miss Kelly has, we think, wisely emphasized the fun. And she is by no means disposed to pull a long face over the pedagogical part of the business, noting, as any disinterested observer might, the extravagant absurdities to which accepted theory and method often lead. At times her lightness of touch approaches flippancy, even in dealing with lofty themes and persons. In presenting the apparent discrepancy, always a crux to childhood, between the Golden Rule and fighting for one's God and country, she is well-nigh guilty, it seems, of lèse majesté. Isadore Belchatowsky's uncle has been "sent up" for shooting a policeman, and Isadore wishes to know why, since George Washington and "Teddy Rosenfelt" have apparently been made "presidents of it, and papas off of countries" for doing precisely the same thing on a big scale. His small compatriots decide that the trouble lies in the fact that the officer was not really killed, and that there were not enough of him:

> George Wash'ton he kills 'em all bloody and dead. . . . Sooner you ain't killed somebody bloody and dead, you couldn't to be presidents and papas off of countries.

It does not occur to Miss Kelly to take this as a text for a sermon, but it occurs to Mr. Roosevelt. "Teach them," he says with some solemnity, writing to Miss Kelly, "that the wrong is not in fighting, but in fighting in a wrong cause, or without full and adequate cause, and you teach them what is true and right, and what they can act up to." This is good and sensible advice, of which, presumably, Miss Kelly stood in no especial need. "Pedagogically considered," she remarks good-humoredly, "that story is atheism."

The Tracks We Tread. By G. B. Lancaster. New York: Doubleday, Page & Co.

In his Australasian tales Mr. Lancaster has added a distinctive chapter to that modern interpretation of British colonial life which began with Kipling's "Plain Tales from the Hills." Kipling's hall-mark is upon it as a whole. Its salient traits are terseness and vividness of phrase, a grim humor prone to deal with the less savory aspects of the theme, and an unconquerable instinct for the romantic aspects. "Donovan Pasha" and "Sons of Men" are lineal descendants of "Under the Deodars." "The Tracks We Tread" lead us into the sheep-country of New Zealand, among a class superficially more like our Western ranchers than the official Englishman. Yet it is the Briton bearing the sacred torch to the farthest ends of the earth whom we are once again called upon, not unwillingly, to admire: the type of those "who go away many times to endings unchronicled; men who love, who conquer, and serve, on the downs, the harsh mountains, the unhandled plains." The series of sketches builds up a story sufficiently intelligible in the end, though at the outset technicalities of phrase seem, as Kipling's did, to impose a deliberate obstacle. Apart from this matter, Mr. Lancaster's style is terse and vivid to the extreme—indeed, almost monotonously so. His pictures are as brilliant as darts of electric flame:

> He stood by in the cold, bright-starred night. . . . Sheer behind the whare the bush rose up to the sky. The babble of a creek two yards off, mingled with the distant roar of the shingle river and the low brush of horses cropping long grass. The little sod whare was sallow in the faint light. Each step and word rang in the frosty air.

His narrative never proceeds, it is always at full gallop, and sometimes leaves the reader breathless:

> By the blaze of Phelan's one door-lamp Randal caught sight of Art's back in the bar, with Roddy Duncan's bright face beside it. He slung through the township full-speed, took the track past the creek to the Lion, and learnt from Fysh that Ormond was three miles off with Father Denis. He turned then, with wrath on his mouth; rode back, and flushed Ormond in the smoke of the priest's little den.

With all its realism of detail, the feeling of the story is romantic, and its outcome as right as the most impatient sentiment could demand.

The Exploits of Arsène Lupin. By Maurice Leblanc; translated by Alexander Teixeira de Mattos. New York: Harper & Brothers.

Arsène Lupin is a French counterpart of Mr. Hornung's "Raffles," the hero of short stories of criminal mystery treated from the criminal side. Yet if Gallic traits are displayed by Lupin himself, they are displayed quite as much by his creator. For every trick which the criminal plays on his victims, the author is playing one on his readers. All those rules of fair play which have been formulated for the benefit of the reader of fiction of this type are here thrown to the winds. For example, a number of stories in the present collection are told in the first person. In all these curiosity is aroused as to where Arsène Lupin is, and what he is doing. But sometimes the narrator turns out to be a victim, sometimes a bystander, sometimes Arsène Lupin himself. This is gross betrayal of a trusting reader. Or, in certain stories, Lupin is introduced under other names, and after going half or two-thirds through a story under an alias which the reader accepts without question, he unmasks between sentences. Even Sherlock Holmes comes into these stories under the thin disguise of Holmlock Shears. All this is not melodrama but Christmas pantomime.

Yet the character which M. Leblanc has created, an arch criminal who controls a newspaper of his own for the recording of his strange exploits, whose selfish criminality is relieved constantly by acts which are generous or patriotic or merely spectacular, is one to afford a good deal of entertainment. The stories, aside from the unaccountable manner of their unfolding, are of uneven merit, but some are capital.

The Flight to Eden: A Florida Romance. By Harrison Rhodes. New York: Henry Holt & Co.

A singular mingling of the crude and the romantic is here. The opening chapters supply the motive for the flight of a young Englishman to the wilds of southern Florida, thirty-odd years ago. In these chapters raw melodrama is at its most flourishing. In expiation of the infidelities showily indicated—which have caused his wife to commit suicide, Basil Forrester becomes an exile in the wilderness. Here, though the melodrama still rages, brutally and savagely, it acquires a certain fitness from being enacted to the rhythm of wild woods and lonely waters. And next an idyl takes occupancy of the scene, and sings prettily in the surrounding barbarity, while hints of early, even of legendary, Florida, supply a glint of historic interest. The romance closes in the Everglades on a fascinating cluster of little bridge-joined islands—evil exorcised, atonement fairly under way.

Ewing's Lady. By Harry Leon Wilson. New York: D. Appleton & Company.

"Ewing's Lady," once begun, is not easily to be laid down unfinished; and in some of the characters there is enough human truth to assure the volume a place among those books one takes up in an idle or weary breathing space—books that fall open of their own accord at favorite pages. These pages will probably be in the first half; toward the end the style is less crisp. Yet the shades of the prison house of conventional melodrama, which begin to close with Teevan's entrance upon the scene, are brightened by the young frequenters of the Monastery. They are refreshingly real and alive, and their delicious fooling will draw from portly expatriates of Bohemia the tribute of a reminiscent chuckle. Indeed, it is the drawing of the minor characters and their environment that gives the book its charm: the cowboy in the clear, heady Colorado air, the genial freemasonry of the studio, Clarence, the lovable convert from civilization, dyspepsia and predigested food, and Ben Crider, fit associate for Billy Brue. The story, which the reader can more pleasurably consume at leisure than bolt in tabloid form, suggests Crawford's "Whosoever Shall Offend." The comparison, however, is not one that "Ewing's Lady" need find odious.

The Origin of the English Nation. By H. Munro Chadwick. New York: G. P. Putnam's Sons.

This is a noteworthy volume in the Cambridge Archæological and Ethnological Series. From the reviewer it deserves a succession of special articles, inasmuch as each of its twelve chapters is an essay crowded with points which suggest debate. Most writers on the coming of the Germans to Britain lazily repeat the words of Bede, but Mr. Chadwick is not willing to take without further question the statements of a single chronicle that was written long after the days of the migration. He has sought "to make use of all branches of ethnological study—history, tradition, language, custom, religion, and antiquities."

For most readers the central interest of the volume will be found in its discussion of the relations between Angles and Saxons. Bede, it will be remembered, makes a categorical distinction. In express terms he tells us how in Germany the Angles lived between the Jutes and the Saxons. He calls the Saxons, Angles, and Jutes the three most powerful nations of Germany. He says that Continental Anglia remains to his own day a desert, as a result of the migration—Continental Saxony, of course, being continuously occupied. In a word, he distinguishes between the races throughout his whole text. Mr. Chadwick is quite willing to accept Bede's statement regarding the separate origin of the Jutes, but he feels sure that there could have been no real distinction between Angles and Saxons. The West Saxon writers, he points out, "called their language Englisc, and regarded their nation as part of Angelcyn." More than this, we have "the overwhelming fact that a social system, of a type unique among Teutonic nations, and differing essentially even from that of Kent, is common to the Saxon kingdom of Wessex and the Anglian kingdom of Mercia and Northumbria." The close distinction which Bede draws between the nations is, in Mr. Chadwick's eyes, a pure bit of theorizing based on the existence of territorial terms like Wessex, Essex, and Sussex, standing off from East Anglia and Middle Anglia. As for the origin of these antithetical terms, Saxon was the word employed by alien peoples, whereas the tribes in question termed themselves English. Mr. Chadwick does not deny that at an early period there may have been a difference between Angles and Saxons, but he strongly contends for their homogeneity at the time of the invasion of Britain. Positive evidence for this view is chiefly to be sought in a scrutiny of social systems.

While emphasizing what is undoubtedly the most novel feature of Mr. Chadwick's book, we must not omit to mention two or three other subjects which he treats with both fearlessness and caution. From the English in Britain he is carried back to the race in its Continental home, and here the question arises, "Are we to believe with Bede that the English dwelt to the south of Jutland, or was Adam of Bremen correct when he said that they dwelt originally on the Rhine?" In this case Mr. Chadwick stands by Bede—a fact which leads us to say that the present volume is not to be thought of as a paradoxical attack upon our most venerable chronicler. The chapters on "The Cult of Nerthus" and "Social Conditions of the Roman Period," are other striking portions of this candid work.

Jay Cooke: Financier of the Civil War. By Ellis Paxson Oberholtzer, 2 vols. Philadelphia: George W. Jacobs & Co. $7.50 net.

Jay Cooke died in 1905. For thirty years he had been withdrawn from public life, and, in the minds of all but his own generation, his name was associated with the financial panic of '73, and with probably little else besides. He died a rich man, yet despite this vindication of his ability to make good the pledges offered to his creditors at the time of the failure of his banking house, recollection of him as a figure of disaster survived the fame which his signal achievements as bond broker for the Washington government earned for him during a period only ten years earlier. None the less, his public services make his position secure, and the historian, who estimates accomplishments by their ultimate effect rather than by the brilliancy of their execution, is certain to take larger account of him as time goes on. To such students Dr. Oberholtzer's volumes offer themselves as a standard work of reference.

By the biographer's statement it would seem almost as if Jay Cooke, during the entire period of his activities in behalf of the government and later, had in mind the preparation of a life of himself which should bring out in detail, with documentary corroboration, the salient facts of his work. At his death, one of his daughters had a number of chests filled with written memoranda upon his own operations, as well as all the letters, both business and personal, which had passed between himself and those with whom he had dealings. This correspondence was chronologically arranged, and, with few breaks, covered all the years involved. From material obtained from Cooke's brothers, who were closely associated with him in business, and by reference to the records of the Treasury Department, and to newspaper files, Dr. Oberholtzer was able to fill the gaps, and to connect and interpret the events of Cooke's life. Every page offers evidence of diligent and intelligent search, and, though the author's evident admiration for the character of Cooke probably softened his criticism of, among other things, the expedients to which the latter resorted in popularizing the government loans, this restraint seems not to have resulted in the rejection of facts which would throw important light upon Cooke or his associates, or upon the plan and nature of their operations. To be sure, Dr. Oberholtzer indirectly seeks to disarm criticism by allusion to the frankness of Cooke's attitude; but this is an open defence, and the individual judgment of each reader will determine its justification.

The two volumes, amply illustrated with portraits and facsimiles and satisfactorily indexed, contain over twelve hundred octavo pages and cover the full period of Jay Cooke's eighty-four years of life. Of these pages more than five hundred deal with the work of Cooke in disposing of the Federal loans during the Civil War, and three hundred pages more with the handling of the Northern Pacific Railroad. This latter task, while gigantic in view of prevailing conditions, especially the financial, was avowedly the project of private enterprise with large profits as its inspiration. And though its conduct emphasizes the qualities which made Cooke so successful as the agent of the government, it contributes comparatively little additional knowledge of him as a financier. It was this railroad project which ended his career as a banker and precipitated the panic by which it has been his misfortune to be remembered; and, while to his indefatigable labor was largely due the opening of a vast Northwest territory, his own part is overshadowed by the extraordinary triumph of his earlier achievement.

Of the operations which related to the disposal of the 6 per cent. bonds of 1861, the five-twenties of 1863, and the great issues of seven-thirties, of which alone Cooke sold seven hundred million dollars in one hundred and forty days, Dr. Oberholtzer gives a clear and interesting account. Fortified as this narrative is by the reproduction in its entirety of much of the correspondence between the banker and Secretary Chase and his successors in office, supplemented with statements from Cooke's own memoranda, it possesses authoritative value. Exception may, however, be taken to the reprinting of such frequent quotations from contemporary newspaper reports, which often reflect rather the political animosities of the hour or the exuberance of popular rejoicing than intelligent consideration of affairs. But without some, at least, of these contemporary accounts, the peculiar difficulties of the undertaking could scarcely be understood. The new generation probably will relish especially those pages which describe the scenes in and about the banking office on the days when subscriptions poured in faster than even the largely augmented clerical force could handle them, and when Cooke sent to Washington a "muff box" filled with telegraphic orders for bonds from his outside agents. These sketches give an impression of what was accomplished, which columns of analysis and of figures alone fail to convey.

The secret of Cooke's success Dr. Oberholtzer ascribes to his ability to infuse others with his own supreme confidence, to his unceasing personal participation in all the operations, and to his lavish use of every means of advertisement. Newspaper support, when it did not respond to his explanations and appeals, as it usually did, he often deliberately purchased with gifts to those in charge. Show cards, pamphlets of ingenious construction, hand bills, "everything likely to catch the eyes, impress the minds, and draw the money from the pockets of the people" were employed.

It was the keenest of ironies that Cooke should finally fail when his personal fortune was at stake. Yet, he was eventually enabled to profit from an almost forgotten and insignificant investment, so that the last twenty-five years of his life he spent as he liked, in the open and at home among his children and grandchildren. Of these closing days, there is more than one picture in the second volume which tends to modify the estimate of Cooke's character derived from earlier reading; and the final impression is that of a resourceful, cheerful, vigorous man, of broad sympathies and simple personal tastes.

Science.

The Art and Craft of Garden-Making. By Thomas H. Mawson. New York: Charles Scribner's Sons. $10 net.

The Garden Month by Month. By Mabel Cahot Sedgwick, assisted by Rohert Cameron. New York: F. A. Stokes Co. $4 net.

Four Seasons in the Garden. By Eben E. Rexford. Philadelphia: J. B. Lippincott Co. $1.50 net.

Eversley Gardens and Others. By Rose G. Kingsley. New York: The Macmillan Co. $1.75.

Gardens yield three sorts of pleasure. First, there is the pleasure which springs from dwelling in the garden itself, surrounded hy its treasures of verdure and of floral beauty. Second, comes the much greater pleasure to he derived from writing hooks about gardening; and this is directly proportioned to the degree of inexperience. Those who know least ahout the sound principles of successful horticulture, but who are filled with delight at their first contact with the soil and with growing plants, are the happiest authors. These are the writers who are ohservant of the caprice of plants, and are fond of telling exactly how they have humored the whims of their pets. These naïve confessions of unskilled gardeners are filled to the brim with joy. And, lastly, there is the pleasure derived from the perusal of gardening books. Almost all of these books are produced hy enthusiasts. It is upon this attraction that publishers count with safety: they are sure of at least a fair patronage in the case of even the poorest gardenhook, for many people are addicted to the garden-book habit. This habit once formed is hard to hreak off, and it leads to the filling up of shelves with vain repetitions. If one should apply the well-known arithmetical device of cancellation to a shelf of modern garden books, and strike out from the pages the directions and descriptions common to all, the remainder would be almost a negligihle quantity. But, fortunately, the repetitions are presented in diverse phraseology, and are tinged by the colors which helong to the different temperaments of the authors.

The volume first upon the list at the head of this notice, is the third editlon of a heavy quarto which has proved deservedly popular on account of its symmetrical proportions and its good sense. Here and there the author indulges harmlessly in fine writing, but after a quaint fashion which is rather attractive. The treatise ls one which the landscape architect can use to advantage, and which will assist owners of estates to correct the mistakes of their gardeners. It is a better book for England than for any part of our own country.

"The Garden Month by Month" is a serlous and successful attempt to answer the questions of amateurs. The subjects of color, date of flowering, and the like, are presented ln a tahular form, in such manner as to indicate the range of use for decoratlve purposes, of about all of the plants availahle ln our Eastern States. The author ls a true lover of plants and of gardens, and a firm believer in their usefulness in modern homes. She was fortunate ln securing the aid of Mr. Cameron of the Harvard Botanical Gardens, well known as a graceful writer on things horticultural, and a good authority in regard to cultivated plants.

"Four Seasons in the Garden" is a volume of convenient size which gives much chatty informatiou of a popular character about the common plauts of the conventional garden. Its closing chapter on the subject of Rural and Village Improvement Societies is well considered, and contains advice which ought to he widely followed.

Rose G. Kingsley (Officier de l'instruction puhlique) presents in her modest little work, "Eversley Gardens and Others," a good deal of well arranged information ln regard to the management of soil and plants. The author has a vein of pleasantry which brightens many of the pages ln a charming way. She is very tender-hearted and most charitable, as is well shown by her refusing to sympathize "with a certain clerical groom-gardener of our acquaintance, who, when asked with profuse apologics, to leave his digging at a psychologic moment and drive to a village flower-show, replied with alacrity, 'I always loves to go around and see how bad they does.'"

All recent garden books make full use of the enormous capahilities of the photographic reproduction processes and, as a rule, do not abuse the privilege. Some of the reproductions in color-printing are admirable, and a few of them are practically faultless.

Important results of experiments carried out by Professor Lannelongue, in connection with Dr. Achard, one of the most favorably known practitioners of Paris, have been communicated to the Académie des Sciences concerning the influence of diet in experimental tuherculosis. Sixty male guinea pigs were divided in three equal series of approximately equal weight. They were first put under a common diet; for eleven days they did not change weight. Then, on the same day, each series of twenty was inoculated with a uniform dose of the same emulsion of tuberculous bacilli. Each series, while continuing the common diet to which they were already accustomed, was then given a different supplement of food. Each animal of Series No. 1 had a nine-gram ration of hutter; each of No. 2 had twenty grammes of sugar; each of No. 3 had twenty grammes of gluten. Each supplement answered to an isothermic diet of about 145 calories. The results were remarkahly definite. The series subjected to the butter diet had all died in forty days; that of the sugar in eighty-seven days; while the gluten series lived on for three hundred and seventy-one days hefore total extinction, that is, for more than a year. These results confirm the previous conclusions of the same investigators that nitrogen should be given a large part in the diet of tuberculous patients.

The Rapport Fernet, presented to the Académie de Médecine Novemher 19, gives interesting results of a thorough investigation made in Paris hospitals and asylums as to the part played by alcoholism in the general mortality. The doctors of the different services established regular ætiological statistics during fifteen months. Out of a total of 1,560 consecutive deaths in the general hospitals, alcoholism was the cause in 33.81 per cent. or more than one-third of the cases; it was the principal cause in one-tenth (10.20), and it was an accessory or auxiliary cause in two other tenths (23.61). This lethal influence of alcoholism is less marked among women than among men, hut the difference is not so great as might be supposed. While the average among deaths of males was 38.81, that among females was 27.29 per cent.; in other words, approximately two women die of alcoholism to three men. In lunatic asylums the statistics are far more terrifyiug. Alcoholism intervenes as a cause of disease and death in nearly half the cases of men, and in one sixth of the cases of women. Sometimes it is the principal—*vera causa*—of death, as in meningo-encephalitis, cerebral ictus, liver, cardio-vascular or kidney manifestations; sometimes it is the auxiliary cause, as in pneumonia or pulmonary tuberculosis. M. Fernet urges that the official statistics of disease should attrihute to alcoholism the deaths really due to it as principal cause, and not, as now, dissimulate the truth under cover of the names of the particular organic affection which it produces. If this were done, it would be seen that alcoholism and tuherculosis take the first place among causes of mortality. If the *Bulletin hebdomadaire de la statistique municipale* puhlished the fact that, out of the 1,000 deaths (the average figure) of each week, from 150 to 200, and perhaps more, are due to alcoholism as their exclusive or auxiliary cause, it is possible that such information popularized by the press might have a salutary influence. He concludes that alcoholism in France is not only one of the chief causes of death and mental alienation; it is also a veritahle social danger. It is the duty of all who care for public health to denounce and combat it.

The second volume (the first being still in the press) of the important "Anthropologie bolivienne," by Dr. Arthur Chervin, has just been puhlished in Paris. It is entirely taken up with anthropometry (436 pages and illustrations). These volumes give the results of the expedition of the "Mission scientifique Bréqui-Montfor et Sénéchal de la Grange" sent out by the French government some years ago.

Drama.

Rosen: Vier Einakter. Von Hermann Sudermann. New York: G. E. Stechert & Co.

Few will venture the assertion that Sudermann's hand has already lost its technical cunning; hut two disappointments await his admirers in his latest venture, a series of one-act plays grouped around the rose, which figures in each story with a different symbolism of passion. To begin with, one must regret that this gifted master has contented himself with action so short and circumscribed as to afford hut a limited flight, and a hrief and ill-sustained climax. Again, the author not only strikes into no new paths, but he sounds once more the same depressing and tragic tones that dominate his previous

dramas—the self-assertion of the individual at any cost. "Die Lichtbänder," for example—just produced for the first time at the Hoftheater in Stuttgart—reveals the sinning wife, lured to a bower of roses and persistently staying in its suffocating atmosphere, and her seducer, who pretends to be true to the soul he has dragged down to the dust. In this analysis of the woman's mind, as well as in the fainter outlines of her worthless companion, Sudermann shows his power in the study of humankind, but the injured husband seems hardly consistent. This man, known for resolute action and a vengeful temper, gives way at the last, but not until he has made concessions, scarcely possible for the average mortal.

In "Margot," the touch of Sudermann is still more clearly recognizable. An unscrupulous woman and an erring daughter are groping for the light. In "Der letzte Besuch," we have another social cancer, on which Sudermann, without squeamishness, turns the full glare of his startling searchlight. Here, again, the woman of the world is borne down with the weight of a dual life. Her intrigue results in her victim's death and the revelation that, at the last moment, he had married another—the humble horse-trainer's daughter, who loved and silently gloried in the possession of his affection. In her dignified declaration and the return of the roses to the gay woman, Sudermann attains to as dramatic a moment as is found in any of the four plays.

"Die ferne Prinzessin" is a comedy designed to teach, or at least to present for consideration, the curious precept, that only the non-genuine—as the artificial rose snatched by the princess from her hat for the love-struck student—will not fade and perish. Here again Sudermann may be nearer truth than error in suggesting the mutability of real things, the notion that only distant ideals, like the distant princess, may be worth following after.

Sudermann has tried to give as much finish to these separate plays as to a great single composition, and he has cleverly bound them together by an underlying sentiment.

Chatto & Windus of London and the Duffield Company of New York have begun a series of desirable volumes under the general title of the Shakespeare Library. One division of the library is to contain the Shakespeare Classics, issued under the general editorship of Prof. I. Gollancz, and of these two volumes are now before us, handsome little books that will tempt a good many persons to read for the first time the sources from which Shakespeare got his plots. One is Lodge's "Rosalynde," the original of "As You Like It," edited by W. W. Greg, the other is Greene's "Pandosto," the original of the "Winter's Tale," edited by P. G. Thomas. In both the spelling is modernized, and there is the additional help of introductions, notes, and glossaries. The aim has been to interest the general reader in this quaint fiction, and the method promises some success. If anything, the error has been to assume too much ignorance on the part of the reader. What purpose, for instance, is fulfilled by defining "puff" in the vocabulary as "gust of wind," or "sack" as "to plunder," or "dolorous" as "grievous"? Is it supposed that any possible reader of Greene does not know the meaning of these words? This, however, is a slight blemish, and does not mar the value of what promises to be a useful and pleasant series of books.

Charlotte Porter, Pietro Isola, and Alice Hervey collaborated in the translation of d'Annunzio's "La Figlia di Jorio," which has just been published by Little, Brown & Co., Boston. The result is not likely to be satisfactory either to students of the poet's works in their original tongue, or to the English reader who seeks to find in it the secret of his great literary reputation. In a rather rhapsodical preface, Miss Porter says:

> It seemed hopeless to attempt to give any glimmering impression of the rhythmic beauty essential to the mystical soul of this tragedy, save by seeking to reproduce for English ears, by similarly free methods in freely stressed English verse, an audible impression corresponding to the impression which the stresses of the Italian verse have made on my ear as they were spoken.

Unfortunately it is precisely in this quality of rhythmic beauty that this translation is conspicuously deficient. In the effort—hopeless, indeed, in the case of languages so different in form, structure, and genius—to reproduce in the rugged English the accent and metre of the liquid Italian tongue, all the swelling harmony and cadence of the original have been sacrificed, together with most of its poetic or dramatic import. D'Annunzio's verse, inspired or uninspired, has been converted into prose, prose cut into arbitrary lengths, to be sure, to suggest poetry, but undeniable prose, halting, undistinguished and often exceedingly awkward. Stripped of all its literary graces, in this merciless fashion, the tragedy, which in its best estate is laden with inconsistencies and extravagances, would not take very high rank even as melodrama, were it not for the antiquarian learning displayed in its application of rural folk-lore and superstitions, and the classical tone imparted by the appearance of the villagers in the guise of the ancient chorus.

The single novelty which Signor Novelli has given us thus far this season is the "Nerone" of Pietro Cossa, a piece having some literary pretensions, but not much dramatic value. It is, indeed, a series of episodical sketches, rather than a play. Glimpses are given of the Emperor, in dalliance with a Greek dancing girl, absorbing the satirical flatteries of his favorite buffoon as he rhapsodizes about art, swilling in a tavern, presiding over an imperial feast, grovelling in terror when his associates forsake him, and killing himself in cowardly despair. Amid the varying situations Signor Novelli finds ample opportunity for revealing the extent and variety of his theatrical resources, but his impersonation has very little about it that is either Roman or imperial. In make-up it is especially unfortunate, and in action, notwithstanding its cleverness in places, it tends constantly to the grotesque. Signor Novelli has skill, humor, and passion, and a wonderful gift in eccentric comedy, but he seems to be deficient in constructive imagination. In dealing with a complex character like that of Nero he is more successful in illustrating its particular traits than in blending them into vital or even plausible individuality.

By the death of James Henry Stoddart on Monday, at Sewaren, N. J., the American stage has lost one of the last survivors of the old school of thoroughly qualified actors. Born at Barnsley, Yorkshire, England, in 1827, he went upon the stage in early youth, and passed through an arduous apprenticeship in various provincial theatres. In 1854 he came to this country, and secured an engagement with the elder Wallack, while Burton, Blake, John Brougham, and other famous comedians were still in their prime. It was in the company of Lester Wallack that he made one of his first great hits in the part of Mark Meddle in "London Assurance," which he played with somewhat broad but perfectly irresistible humor. Later he acted with Laura Keene, Mrs. John Wood, and Dion Boucicault. One of his best known assumptions at this time was that of the lawyer Moneypenny in "The Long Strike." In the early seventies he joined the company of A. M. Palmer at the Union Square Theatre, where for twenty years he grew in artistic reputation. His Pierie Michel was a remarkable performance. Leaving the Union Square he again allied himself with A. M. Palmer at the Madison Square Theatre, whither he long drew crowded audiences by the passion and pathos of his old minister in "Saints and Sinners." He furnished another charming portrayal in Augustus Thomas's "Alabama," and his crowning triumph was achieved in "The Bonnie Brier Bush." It is by parts such as these that he will be longest remembered.

Music.

The Appreciation of Music. By Thomas Whitney Surette and Daniel Gregory Mason. New York: The H. W. Gray Co. $1.50.

The authors of this volume are convinced that out of any score of persons gathered to hear music, whether it be hymn, song, oratorio, opera, or symphony, ten are not listening at all, but are looking at the others, or at the performers, or the scenery, or the programme; that five more bask in the sound as a dog basks in the sun; that two more have their minds filled with visions of trees, mountains, and rivers; while another is busy analyzing themes and labelling motives that he forgets to enjoy. This leaves only two out of the twenty who really appreciate the music by actively following the melodies and living over again the thoughts of the composer. This estimate is perhaps exaggerated and unduly pessimistic; it certainly is, so far as the opera is concerned, but it probably holds true of symphony concerts and the usual recital; many attend these from a sense of artistic duty, as they attend church from a sense of religious duty, though they are bored at both. Is it possible to change this boredom to pleasure, to transform the merely useful patron into a delighted music-lover?

No doubt it is, provided some rudimentary interest in music exists. The trouble with the average concert-goer is that he is too lazy; he tries to enjoy his music passively, as he does a hot bath; but there is more in music than in hot water—to get at it, however, the listener must give it active attention, and that is what he fails

to do, often simply because he does not know how to begin. He needs some guidance as to what to listen for among the many confusing sound impressions. The object of the present volume is to supply such "guidance to awakened attention," in an untechnical manner; to teach the hearer how to concentrate his attention, to focus his mind as well as his ears on the melodies and harmonies, to "substitute for that 'drowsy revery, relieved by nervous thrills,' an active, joyful, vigorous coöperation with composers, through which alone he can truly appreciate their art." In furtherance of this purpose, the authors give a survey of the development of music from the most primitive sounds grouped together in rude patterns by savages up to the symphonies of Beethoven, showing how genuine music is based on short characteristic groups of tones called motives, and how these are made to take on variety, without losing unity, by being "imitated," "transposed," "restated after contrast," "inverted," "augmented," or "diminished," "shifted in rhythm," and otherwise manipulated. Special sections are devoted to folk-songs, the polyphonic music of Bach, the dance and its development, the suite, the rondo, the variation form, and the sonata, while the last four chapters are devoted to Beethoven.

All this is commendable. The question is: Will those who are too lazy to follow music in the concert hall with attention have the courage and application to read and apply the lessons here placed before them? There's the rub. We feel somewhat skeptical as to the value of musical anatomy for the purpose of stimulating an interest in the art. We need not study botany to appreciate the beauty of roses and pansies; such study, in fact, subordinates the artistic interest to the scientific. To appreciate flowers we must see them early in life and often; and so with music; it is only by hearing it from childhood, at home, in church and school, in concert halls, and at the opera that we learn to listen to it attentively, actively, and with keen enjoyment. A textbook, no doubt, may help, by calling attention to hidden beauties. The sub-title of this volume is "A Course of Study for Schools, Colleges, and General Readers." Teachers will no doubt find not a few useful hints in it, and the general reader also would do well not to ignore it. There are excellent things, notably in the chapters on Bach and Beethoven. An inkling is given of the vast treasure that lies hidden away in Bach, whose works "have that delicacy of inner adjustment more usually found in the works of nature than in those of man; their melodies grow out of their motive germs as plants put forth leaves and flowers." The best thing in the book is the chapter on Beethoven's humor, which dwells upon this master's "fondness for breaking in on the tranquility of his audience, sometimes in danger of lapsing into inattentive dulness, with all manner of shocks and surprises—clashing chords in the midst of soft passages, unexpected modulation to distant keys, piquant interruptions of rhythm, long holds, sudden spasms of speed."

When Mascagni made his ill-advised visit to this country, five years ago, he labored under the delusion that the American public, impressed by his fame as the composer of "Cavalleria Rusticana," would flock to see him and hear his productions, no matter what they were, who the singers, and how high the prices. He hired the Metropolitan Opera House, and, with a poor orchestra and mediocre singers, produced some of his operas which had enjoyed very little success, even in Italy. A disastrous result was inevitable. One of the works performed on this occasion was "Iris"; it made a fairly favorable impression, yet it did not seem likely that it would ever be heard here again. It is an opera on a Japanese subject, and possibly the remarkable success last season of Puccini's "Madama Butterfly" suggested that the time was opportune for a revival of "Iris." Revived, at any rate, it was at the Metropolitan Opera House last Friday; and Emma Eames, who made her reappearance in the title rôle, presented an interesting series of pictures of the young girl who is stolen from her blind father and taken to the Yoshiwara, or "red-light" district, where he finds and curses her and she commits suicide in a gutter. It is a sordid story, and the music is for the most part commonplace, unrelieved by any of the crude but fresh tunes which made "Cavalleria Rusticana" popular. Caruso and Scotti were in the cast, but had few opportunities to excite interest in their actions and singing. Such success as the opera may have will result entirely from the fine art of Mme. Eames, who is in her prime as a singer, and who as an actress has made immense strides in recent years. Time was when she would disguise her Marguerite in costly Parisian gowns. In "Iris," on the contrary, she not only wears Japanese gowns, but wears them as one who has been instructed in Japanese garbing, posing, gesturing, and gait by no less a personage than Sada Jacco.

The next event of importance in the musical world will be the arrival of Gustav Mahler, who is to be conductor in chief and artistic manager of the Metropolitan Opera House. His method of work, as exemplified during the ten years when he was director of the Imperial Opera in Vienna, is so different from that persued at the Metropolitan, where there is seldom time for more than one rehearsal of an opera, that one wonders what will happen when he takes cognizance of the situation here. That there will be an explosion of some kind seems certain. The "Music-Lovers Calendar" for 1908 (Breitkopf & Härtel) opportunely brings an article on this distinguished musician, concerning whom the writer remarks:

> Surely, no other is so devotedly loved and so bitterly hated, enthusiastically supported, and so violently opposed as this same man who quietly and steadily pursues his way, making not the slightest concession to either side, and believing in himself and his ideals with all the force of his intense nature.

Other famous conductors are discussed in the same "Calendar" in an article by Prof. W. R. Spalding of Harvard on the Boston Symphony Orchestra, and another on the Pittsburgh orchestra by A. M. Foerster. A. de Bertha writes on Hungarian music, combating Liszt's statement that the Magyars had no music of their own, but only such as came to them through the gypsies. Prof. Edward Dickinson has an interesting article on the Literary Work of Composers; while Edmund J. James discusses Music in American Universities. The Calendar is published under the auspices of the School of Music, University of Illinois.

Art.

Goldsmiths' and Silversmiths' Work. By Nelson Dawson. New York: G. P. Putnam's Sons. $7.50 net.

This new volume of the Connoisseur's Library is, like the others, light in the hand and pleasant enough to handle, in spite of an octavo page nearly 10½ inches high, and 267 such pages; and also inserted plates for half-tone illustrations of silver and gold vessels. There are 127 separate figures. The author in his preface enters a plea "for the indulgence of readers" because "an artist is, or should be, a poor talker." Without granting the generalization—for there are many exceptions—we admit that in his own case Mr. Dawson's caveat is not without reason.

The first chapter, which deals with gold and silver ore and the working of the metals, is a most curious collection of statements—crazy fables of mediæval collectors, mixed with brief descriptions of ways of using gold, with discussion of alloys and preparations, and with the simple facts of discovery in India, in America, in Australia, and in Africa. But even in this record the matter is unsifted, unarranged, and unconvincing. This chapter, or "part," deals also with the beauty of gold.

Part ii. contains nearly half the volume, and within these 105 pages are treated, in a kind of historic sequence, but without subdivision and without system, those familiar periods of the goldsmiths' art which we generally deal with when considering the collections of museums. Prehistoric, Etruscan, Greek, Roman, Byzantine, and mediæval plate are all discussed in one continuous essay, as if a collector with plenty of examples on the table before him were to talk loosely and easily about them. Such subjects as Roman ostentation and Roman extravagance are introduced into the discussion of Greek and Italian silverware, although the pieces which the author has to show and the pieces which are preserved in our national and private collections are not extravagant, but are noticeable for simple effectiveness and admirable results produced at slight expense. The silverware of the Hildesheim find, of the Bernay treasure, of the specially important diggings at Boscoreale, and the magnificent gold vessels of Petrossa—even they are far from showing extravagance. The remarks about "Roman extravagance" seem to be based on the highly wrought goblets, generally of silver, which are preserved in certain great museums. Figs. 4 and 5 give two vessels from the Hildesheim treasure, one of which offers that familiar design of laurel twigs with leaves and berries in high relief, wrought by the hammer in the thin silver shell; Figures 13, 15, and 16, all on the same plate, give three more such vases, the design of one of them being closely akin to that of the Hildesheim cup, and the others not remote from it in spirit and meaning, and still more closely akin in workmanship. Without trouble, the exquisite vase in the museum at Saint-Germain, found in

the trenches at Alise-Sainte-Reine and thought to be from Cæsar's camp before the Gaulish stronghold, Alesia, might have been included. This, also, is adorned with laurel leaves and berries, the natural branches being tied together with ribbons according to what we have learned to recognize as a familiar theme, probably suggested by the wreathing of the cup by the natural green branch on various festival occasions. Again, the superb cup in the Naples Museum, often photographed, might be added. When we think what the Roman world between 30 B. C. and 400 A. D. had collected, used, and forgotten, when we remember that the tangible wealth of the Mediterranean lands found its visible expression largely in beautiful objects of metal, it should not seem strange that fifty or sixty fine pieces are left to us. We hope that the digging in Herculaneum, so often proposed and as often postponed, will bring forth infinitely greater treasures in that way than we now possess.

Much space is devoted to Renaissance work, and of all the illustrations the most important is undoubtedly the Nef, Fig. 37. This is entitled here "Incense Boat, Padua," and the text speaks of it as probably of German origin. After this, the pieces illustrated are numerous and small. The coffee-pots, tea-pots, drinking vessels, and covered dishes, the candlesticks and spoons are not unusual in character. The silverware of the seventeenth and eighteenth centuries is pretty well known, and yet in a general treatise it is, of course, necessary to deal fully with those familiar epochs. What the student complains of is that we do not learn enough of the peculiarities of make in this or that piece, and are left without the author's explanation of that which must remain doubtful to one who sees only the faint, inadequate, half-tone illustrations. Polished silver does not lend itself happily to such photographic reproduction, except in the case where the ornamentation is minute and in high relief. The beauty of the piece which is simpler and more undivided in its parts easily escapes one who looks at these pictures and finds no special analysis of each object.

"The Art of the Prado," by C. S. Ricketts (Boston: L. C. Page & Co.), is a book entirely out of the usual run of things of the kind. Mr. Ricketts is a painter, and writes like one, that is, with knowledge of the art and with personal views of his own upon it. He uses his own eyes and judges with his own judgment. His book is not a guide-book, a compilation, or a pale reflection of accepted ideas. His style is not always perfectly clear, and one cannot always follow his meaning without some effort, but where effort is occasionally necessary it is worth the making. He has always something to say, and it is something meriting serious attention. His analysis of the art and temper of Velasquez is the best thing we have seen on that artist since R. A. M. Stevenson published his study of the Spanish master, and is a valuable supplement to that study; while his account of the works of Titian and Rubens is nearly equally interesting. His recognition of Rubens as pre-eminently a draughtsman is particularly noteworthy. He does not confine himself strictly to the matter in hand, but draws freely on his knowledge of other galleries for illustration and illumination of the point under discussion, so that something much broader than a hand-book of a particular collection is offered us. We should like to give more space than the press of matter at this time will allow of to a detailed criticism of his opinions—we must content ourselves with the statement that this is a real book, containing real opinions, which may be read with profit and pleasure by any one who cares for the serious study of art. The volume contains, also, some forty-odd well-executed reproductions of celebrated pictures, and is therefore an agreeable possession, merely as a picture book.

G. P. Putnam's Sons publish, under the title "Honoré Daumier" a collection of seventy-six reproductions from the lithographs of Daumier, with an Introductory Essay by Elisabeth Luther Cary. Miss Cary writes pleasantly and well of Daumier's art, finding, however, more good nature and less bitterness and indignation in it than we see there. The pictures lose much by reduction and by absence of the silvery lithographic tone, but afford some idea of the artist's power.

Among the recent acquisitions of the Metropolitan Museum by purchase are La Cour de la Princesse and Dames de Qualité, by Monticelli; a drawing by Rembrandt. The Angel Appearing to Zacharias, an idea probably for a picture; two landscapes in gouache and water-color by Cuyp; two of Gainsborough's landscapes; a pen-and-ink of Domenico Campagnola, the disciple of Titian; and some early studies by Lord Leighton, possibly for his Cimabue.

At a recent meeting of the Anthropological Society at Munich Dr. Albert Mayr gave an interesting account of a necropolis belonging to the early bronze age which has been discovered in the island of Malta. The prehistoric monuments of Malta known hitherto, consist chiefly of stone buildings, probably shrines, which seem also to have been used as tombs. Dr. Mayr, during a recent visit to Malta, has made a careful study of the prehistoric finds of the last few years which have until now remained unpublished. Among these the most important was a subterranean necropolis, which both in its architecture and in its contents shows close connections with the above named shrines. The potsherds, terra-cotta, and stone figurines, and amulets which were found in it all belong to an early period of the bronze age. In other parts of the island remains belonging to about the same period were discovered. This prehistoric civilization, which has a distinct character of its own, seems to have been strongly influenced by Sicily. Especially interesting is the evidence of relations with Crete.

An important archæological expedition is going to the oasis of Siwa on the western frontier of Egypt in the course of this winter. It will be under French auspices, and the leader of the undertaking will be the Viscomte de Mathuisieult, whose investigations in the hinterland of Tripolis a few years ago aroused considerable interest. This oasis, the site of the world-famous oracle of Jupiter Ammon, is expected to yield important results.

An international memorial to Whistler is planned in the form of a sculpture by Auguste Rodin to be placed in Whistler's home, Chelsea, London. The English committee consists of M. J. E. Blanche, Lord Grimthorpe, William Heinemann, Prof. E. Lanteri, John Lavery, Joseph Pennell, the Earl of Plymouth, D. C. Thomson, and H. Wilson. Any member of the following American committee will receive subscriptions: William M. Chase, No. 303 Fifth Avenue, New York; Richard Watson Gilder and Robert Underwood Johnson, the *Century Magazine*, New York; Bryson Burroughs, Metropolitan Museum of Art, New York; Halsey C. Ives, Museum of Fine Arts, St. Louis; Edmund C. Tarbell, Tavern Club, Boston; and Harrison S. Morris, Oak Lane P. O., Philadelphia.

Among the exhibitions in the dealers' shops in this city are paintings by Frederic Remington at M. Knoedler & Co.'s, till December 14; old Japanese prints, Louis Katz's December 14; old English mezzotints, H. Wunderlich & Co., December 24; water-colors by Herbert W. Faulkner, Powell's, December 27; miniatures, by Miss Eulabee Dix, Bauer-Folsom's, December 31; and etchings by Joseph Pennell, Frederick Keppel & Co.'s, December 31.

Finance.

THE RISE ON THE STOCK EXCHANGE.

In attempting to peer into the longer future, and to discover what should be our financial history in the next few years, experienced financiers have been confronted with two conflicting arguments. First, underlying present conditions there are manifest elements of strength—such as the wealth of the interior, the country's power over international exchange, and the soundness, both of the currency and of the national finances—which did not exist during any one of the four great preceding panics. Hence the inference that recovery now should be more rapid, and the intervening depression less severe, than after 1893, 1873, 1857, or 1837. On the other hand, the fact stands forth that, in scope and violence, the shock to the credit system of the country as a whole was greater than on any of these preceding occasions; from this, the argument that the later reckoning may be formidable in proportion to the violence of the panic.

Where shall one look for guidance? Many people, in the East at any rate, point to the Stock Exchange. That mobile barometer of financial weather prophesied clearly, in the prodigious shattering of values during December, 1906, and March, May, and August of the present year, the storm which was to break in the third week of October. If this is so, then the rapid and general recovery, which began in earnest with the signs of returning credit facilities, on Saturday, November 23, and which, with only momentary interruptions, has continued ever since, ought, it is alleged, to mean a prospect of fair skies.

This is a view which even the most conservative business man must take into account. There are, however, two qualifying considerations. One is that substantial recovery was inevitable when the Stock Exchange found itself once more in touch with credit resources. So long as

banks would not lend for Stock Exchange purchases, one great sustaining influence under values was withdrawn. While, moreover, the "buyer for the rise" on borrowed money was necessarily absent, the seller on speculation could not be kept away; and his "short" sales of borrowed stock, which must some time be "covered" by actual purchases, are an important influence when the real buyer has returned. This would indicate that the recovery in stocks has reflected not so much bright hopes of the longer future as the actual restoration of credit, between October 24 and the present week. Another consideration is that, with all the sharp rebound, Stock Exchange prices as a rule have not yet retraced one-fourth of their downward path of the twelve preceding months.

How did the stock market act, and what did its movement turn out to have indicated, in this stage of initial recuperation during previous panics? At the end of August, 1893, the stock market advanced vigorously—exactly a month after Wall Street's panic day, July 26; the interval was just the same between this year's panic day and the start of real recovery. The advance continued with much violence throughout September; slackened in October; was renewed for a day or two after the Repeal of the Silver Purchase act became a law on November 1; and was then succeeded by a long period of depression, political disturbance, and corporation distresses. In Wall Street, as in trade at large, 1894 was a period of hard times; a premature recovery in 1895 was nipped in the bud, so to speak, by inadequate resources; then came the "Bryan scare" of 1896.

Or, if one goes back to 1873, he will find that the New York Stock Exchange closed its doors on the panic day, September 20, and did not do business again until the 30th. This shut-down postponed a good deal of necessary liquidation, so that a longer period than the four weeks of 1893 and 1907 elapsed before prices began their real recovery. That turn was reached November 13; thenceforward, an almost continuous rise lasted until the middle of the ensuing January. This movement stopped when genuine hard times began, at approximately that date, and Stock Exchange depression supervened. It was rather striking that neither in 1874, nor in 1875, nor yet in the two discouraging busiuess years which followed, did values of securities fall as low as the low level of the panic of 1873; but nevertheless hard times continued during the three ensuing years.

The story of 1857 and the following years was very singular. Then, as in the later panics, recovery on the Stock Exchange began when cash payments were resumed, around the middle of December, the New York banks having suspended specie payments just two months before. The recovery lasted, with intermittent reaction, until early in 1858; then came depression, even on the Stock Exchange. At the opening of 1859, hopes began again to brighten, and real recovery set in. It was based on the grain and cotton crops, and it was stopped decisively by a cruel freak of nature in the shape of a killing frost on June 5, which ruined the Northern harvest. Thereafter, all other influences were forgotten, in the face of the coming Presidential election of 1860, and of the campaign for Disunion.

BOOKS OF THE WEEK.

Andresen, N. P. The Republic. Chicago: C. H. Kerr & Co.
Barth, Theodor. Amerikanische Eindrücke. Berlin.
Bell, Lady. Topics for Conversation. London: A. L. Humphreys.

A List of Books for Christmas

AS THE HAGUE ORDAINS—Journal of a Russian Prisoner's Wife in Japan
"Instantly takes rank as far above anything preceding it."—Living Age. ($1.50 net.)

LAYARD'S SHIRLEY BROOKS OF "PUNCH"
His Life, Letters, and Diaries
"A most entertaiuing biography . . . One might go on indefinitely quoting good things out of the volume . . . the illustrations, mostly of initials and cartoons taken from Punch, add much to the interest of the text."—New York Times Review. ($3.50 net.)

PAYNE'S GREATER ENGLISH POETS OF THE 19TH CENTURY
"Besides this work there has not been published a single volume containing comprehnsive and critical appreciation of Keats, Shelley, Byron, Coleridge, Wordsworth, Landor, Browning, Tennyson, Arnold, Rossetti, Morris, and Swinburne . . . the epitome of all that has been written upon these authors."—Baltimore Sun. ($2.00 net.)

JOHNSON'S LEADING AMERICAN SOLDIERS
Biographies of thirteen great U. S. Generals. With portraits. "Much sound originality of treatment."—Springfield Republican. ($1.75 net.)

SHERMAN'S WORDS TO THE WISE—AND OTHERS
Brilliant and fascinating literary and social essays. "The first satisfactory stopping place is the last page."—Springfield Republican. ($1.50 net.)

CHARLTON M. LEWIS'S THE GENESIS OF HAMLET
An attempt to solve the Hamlet problem by a clear discrimination between Shakespeare's original contributions to the story and the legendary materials that he inherited. ($1.25 net, by mail $1.33.)

A CHEERFUL YEAR BOOK FOR 1908
Cartoons by C. F. Lester. Jests by F. M. Knowles. Prolog by Carolyn Wells. A popular-priced edition for 1908 of this humorous engagement book. ($1.00 net.)

ONE HUNDRED GREAT POEMS
Selected from American and British poets by R. J. Cross. A dainty pocket volume. Cloth, $1.25 net; full morocco, $3.00 net.

SINCLAIR'S THE HELPMATE
"An advance on 'The Divine Fire.'"—London Times. (Third printing. $1.50.)

DE MORGAN'S ALICE-FOR-SHORT
By the author of "Joseph Vance." "A remarkable example of the art of fiction at its noblest."—Dial. (Sixth printing. $1.75.)

CALTHROP'S THE DANCE OF LOVE
"An uncommon book, written with a pretty wit and much romantic feeling."—New York Sun. ($1.50.)

RHODES'S THE FLIGHT TO EDEN. A Florida Romance
"There is no question that Mr. Rhodes knows how to portray people and incidents in a way that forces you to see them."—The Bookman.

STEVENSON'S (B. E.) THAT AFFAIR AT ELIZABETH
By the author of "The Marathon Mystery," etc. "A well-constructed detective story. Surrounding the disappearance of a bride a few minutes before the wedding."—Chicago Evening Post. ($1.50.)

CANFIELD'S GUNHILD
A Norwegian-American Episode. "Fresh and readable . . . will move and entertain."—New York Sun. ($1.50.)

For Young Folks (Send for circulars)

BAKER'S THE YOUNGSTERS OF CENTREVILLE
Tales of the good times the boys and girls enjoyed as part of the celebration of the dozen important holidays. (Illustrated, $1.50.)

AMES'S TREASURE OF THE CANYON
A rattling tale of adventure in Arizona. (Illustrated. $1.50.)

HAINES'S LUCK OF THE DUDLEY GRAHAMS
"One of the brightest, most amusing, natural, and readable accounts of home life which has appeared in many a day."—The Interior (Chicago). (Illustrated, $1.50.)

PLUMMER'S ROY AND RAY IN MEXICO
"It deserves the widest circulation in this country, and no public library can afford to be without it."—Boston Transcript. (Second printing. $1.75 net.)

HENRY HOLT AND COMPANY 29 W. 23d St. NEW YORK

JUST READY

AN ECONOMIC HISTORY OF THE UNITED STATES

By E. L. BOGART, Ph.D., Princeton University. With Maps and Illustrations. Crown 8vo. About 500 pages. $1.75.

Beginning with the explorations and settlements that led to the colonization of the continent, the author traces the growth of industry, agriculture, commerce, transportation, population, and labor, from the simple, isolated agricultural communities of the colonies to the complex industrial and commercial society of to-day.

AMERICANA

Our new catalogue, No. 74, lists and describes some 2,100 rare, out of print and valuable books relating to America. It's a collection we're proud of, and if we haven't your name we'd advise you to send it on for a copy. This is a list you'll save for reference.

It will be out of print shortly. Ask for it now.

THE BURROWS BROTHERS COMPANY
CLEVELAND, O.

THE MOSHER BOOKS

My New Catalogue for 1907 will be sent free on request to booklovers anywhere that can be reached by mail. It is simply unique in the annals of Catalogue making, and is the only medium I rely upon for bringing The Mosher Books before the public.

BRENTANO'S, FIFTH AVE. & 27TH ST., carry a complete line of these editions.

THOMAS B. MOSHER
PORTLAND, MAINE

BOOKS—All out of print books supplied, no matter on what subject; write me, stating books wanted; I can get you any book ever published; when in England, call and inspect my stock of 50,000 rare books. BAKER'S GREAT BOOKSHOP, John Bright St., Birmingham, England.

The Nation.

NEW YORK, THURSDAY, DECEMBER 19, 1907.

The Week.

The fleet which has just sailed from Hampton Roads has our heartiest good wishes. For it we desire the pleasantest of "frolics," free from mishaps of every kind. The ships will reach the Straits of Magellan at about the most favorable time of year for a successful passage, and we are confident that wherever they touch they will be cordially received. The Pacific Coast will outdo itself in hospitality, while the whole nation looks on with interest. It has nothing to do with the personnel of the fleet that many citizens and a considerable section of the press disapprove of the venture as ill-timed and rather an injury to the service than a benefit. It is no fault of the officers that the ships, by reason of the blunders of designers, carry their armor-belts below water instead of in the proper place, or that the Navy Department repeats year after year grave errors of design, like the exposure of the magazine to sparks droping from the turrets, and the planning of speeds far below those attained in foreign services. If the cruise to the Pacific should call the attention of Congress to the need of a radical reorganization of the Navy Department, it will certainly not be in vain.

From the Republican unhappy family in Washington come all sorts of unpleasing cries. "Preposterous," "a lie," "treachery," etc., fill the air. From all the discordant sounds, however, one fact comes out clear. Secretary Cortelyou has been and still is a receptive candidate for the Presidency. That is his right, of course, as it is that of every American boy, unless tradition, too, is a liar; but a cool examination of his claims and his chances is all that is needed to show that his nomination next year is scarcely conceivable. He is undoubtedly a capable and well-poised man, very strong on the administrative side; and it is true that he won golden opinions from financiers in New York and elsewhere for his resource and steadiness in the panic week. But what the astute managers of the Republican party would have to consider would be the sort of campaign he could make, and the charges that would instantly echo from every stump if he were nominated. He would inevitably appear as the candidate of Wall Street and Federal office-holders combined. Moreover, after his answer is made to the Senate resolution, it will doubtless appear that he deposited millions of money in so-called Standard Oil banks. We say nothing of the propriety of this act; doubtless it was necessary and fully justified. But think of Bryan shouting about it all through the campaign! Why, it would have been as good policy to talk of nominating Secretary Carlisle, after the gold contracts of the second Cleveland Administration. Finally, it is evident that the question of campaign contributions is to be an issue in the next campaign. With what success could a man hope to run, under whom, as chairman in 1904, the Harriman money and the life insurance money and the Standard Oil money and the Beef Trust money were collected to aid Roosevelt?

Westward the star of Democracy is to take its way in July,—farther West than any convention has heretofore gone. Denver is an attractive place for such a gathering, and has hotels enough to care for the throngs certain to follow in the wake of the politicians. It is, perhaps, a just recognition of the way the centre of political power has swung from the East to the Middle West, that a Presidential Convention of 1908 should be held in a city that was a mere collection of huts fifty years ago, when secession or separation was the chief interest of the Democratic party. In this pure atmosphere and new surroundings, we wish the Democracy might come to some wisdom and decide to secede from Bryan and all his works. In his direction lie only defeat and added demoralization. The chances are that the Republicans will select a candidate worthy of the office. Denver will merely be synonymous with disaster if the leadership is again entrusted to a demagogue become so tiresome and so stale as to make it impossible for him to inject into the campaign any emotion save wonder as to what new and unbalanced scheme he will next offer as a bait to voters.

It is not only the private citizen's budget, or the corporation's balance-sheet, that needs watching. In hard times the public revenue and expenditure call for specially close scrutiny. At present, the tendency is rather ominous. Thus far in the fiscal year, the Treasury is $25,000,000 worse off than it was a year ago. While receipts have fallen off $6,000,000, expenditures have increased $19,000,000. And under the appropriations made by Congress, but few economies can be practised. Though a deficit now exists and is plainly in sight for the whole fiscal year, the Treasury must go on paying out money that Congress voted, trusting to luck. The really fortunate thing is that the Secretary of the Treasury has a large surplus—if he can recall it from the banks. But the unpleasant figures of income and outgo clearly prove that it is not merely our currency system that is in need of reform. Some day Congress will perceive the absurdity of having no centralized and effective control of the national budget.

Comptroller Ridgely's report is chiefly noteworthy for its advocacy of a Central Bank, holding exclusively the right to banknote issues, maintaining branches in the various cities, and controlled by the government, notwithstanding the provision of its capital by private shareholders. This is the plan proposed by the New York Chamber of Commerce Committee in October, 1906, but dismissed by that body at the time as politically impracticable. Mr. Ridgely admits, and indeed summarizes, the real obstacles. The Central Bank should be under government control, and yet "should be kept out of politics." The shareholders should elect their part of the board of directors; but "the men chosen for its managers and directors should be men of the highest character and ability, whose duties and interest would be for the undivided advantage and interest of the bank." These two stipulations are the stumbling-block. If the government has not been able, it will be said, to keep the Treasury out of politics, what could be expected from the vastly greater field of patronage and political profit opened by a $50,000,000 bank of issue and discount? If the shareholders are to be individuals, who is to guarantee in advance what directors they will choose? And if, as has been suggested, stock in the Central Bank is to be held by other banks, is it safe to assume that the managers selected by them would be devoted to "the undivided advantage and interest of the bank"? What Mr. Ridgely says of the value in panic times of such a central institution, commanding world-wide confidence and credit, administering the government's funds and enjoying powers of elastic note-circulation, is entirely true. Probably the present humiliating partial suspension of cash payments, by nearly all the banks of the United States, could not have existed if such a Central Bank, intelligently conducted, had been in the field. But that the Central Bank either would or could have prevented financial collapse as the penalty for six years of financial recklessness, it is useless to contend. The Bank of England, with an ultra-conservative management, was able to avert neither the panic of 1847 nor that of 1866—the two most formidable financial disasters in London's history. By virtually forcing the joint-stock banks to lend fearlessly and to guarantee the Baring assets, it material-

ly allayed the panic of 1890; and its course a year ago possibly averted a London panic for this present autumn; for it "read the riot act," as Lombard Street described it, to the English banks which were putting all of their spare resources at the disposal of the "Union Pacific boom." Whether an American Central Bank could be trusted for the last-mentioned achievement, is doubtful. The Treasury, at least on that occasion, did not exert a restraining influence

---

If there seems to have been undue haste in dispatching Federal troops to Goldfield, the President is, as we have already pointed out, not to blame for sending them. He had no option in the matter, after being called upon by the Governor. Since it now appears that the Governor was either needlessly frightened or otherwise misled, Mr. Roosevelt has wisely ordered a strong commission, comprising the Commissioners of Labor and Corporations and the Assistant Secretary of Commerce to go to Goldfield and ascertain the precise facts. The nation cannot afford to have a repetition of the Idaho charges that Federal troops were used without warrant of law in the interest of the mine owners, and to the injury of the miners. The President has properly, therefore, warned the colonel commanding the troops now at Goldfield that they are to be neither for nor against strikers or employers, but are simply to preserve peace and order, molesting no man who obeys the law. Nothing has as yet appeared to make it clear why the Governor was so alarmed. True it is that the last army register gives the entire strength of the Nevada National Guard as sixty-seven officers and 134 men, and that the State is thus practically without any armed force to uphold the laws. Yet there seem to have been no serious outrages, nothing more than threats. Even the story that an attempt was made to blow up the regulars as yet lacks confirmation.

More than a personal issue is raised in the discovery by agents of the Interior Department that Robert L. Owen, one of the new Oklahoma Senators, himself with Indian blood in his veins, has obtained a 3,000-acre ranch by buying up Indian allotments by means of notes payable when the Indian owners can give an unencumbered title—as they can under legislation which Owen himself is fathering. It must not be forgotten that Statehood has bad as well as good features. There are opportunities for swindling now in the eastern half of Oklahoma which did not exist when the Indians there were wards of the Federal government. Observers like the Boston *Transcript's* correspondent recently in Oklahoma, declare that the white element in the old Indian Territory constitutes the greatest internal danger for the new State. The new right of citizenship conferred upon the Indians means, in the minds of many unscrupulous whites, merely the privilege of signing away their birthright. Congress in the enabling act realized that the Indians, only just promoted from tribal ownership of land, needed to be placed on a little different basis from the other citizens. Of course, the analogy of the swimming lesson applies here almost as much as in the case of the reservation Indians. They must learn in time to look out for their own affairs. Still, if the Indian Senator is animated by the ideals of the exploiters of his race, it is a bad start for Oklahoma.

Doubtless historians will one day write amusing chapters on the benighted days when people played the piano by hand. We trust that they will not have to record also that the American nation took advantage of a number of new and important inventions in music-making to deprive composers of their rights. The question of appliances for the mechanical reproduction of music will be before Congress again this winter. There are some specious arguments used in behalf of the manufacturers of perforated music rolls and talking-machine records. The business of these men is altogether legitimate, unless from the point of view of those to whom all "canned music" is abomination. They do bring music to countless homes which never enjoyed it in any form before. But if that were a sufficient reason for the denial of copyright protection, the book pirate would be equally deserving of special privilege. He, too, by cheap editions, disseminates worthy works more widely than would otherwise be the case. Both, moreover, profit by others' initiative, circulating only those works which have already proved successful in the form which yields some return to the author. If Congress adopts the theory of Representative Currier's bill, which puts all music at the mercy of the makers of perforated rolls, phonographs, and other such mechanical contrivances, Congress might, for just the same reasons, repeal our entire copyright law.

Samuel Gompers returned, at the dinner of the Civic Federation Monday night, to an old mutton of his. It is that wages must not, under any circumstances, be reduced. Workingmen, he said, are not responsible for the panic, and they do not propose to submit to any cutting down of their earnings. Every one must have a great deal of sympathy with the plight of laboring men overtaken by an industrial setback. Especially is there reason for such a feeling after a period of artificially high prices. Whether these result from speculation, or are temporarily screwed up by a protective tariff, the result is equally hard upon workingmen. Yet the kindest consideration for the misfortunes of wage-earners suddenly face to face with depression, must not blind us to the absurdity of such a protest in their behalf. Let it be noted, to begin with, that his plan is squarely at variance with the practice of many labor unions—and, of course, it is only for organized labor that Mr. Gompers pretends to speak. It is a common thing for trades unions to make agreements with employers whereby wages shall vary as the price of the product. This is of the essence of the "sliding scale" of the Amalgamated Association of Iron and Steel Workers. The same principle enters into the fixing of the wages of coal-miners, and was, indeed, recognized by the commission appointed at the time of the anthracite coal strike. We have at this moment another illustration in the case of the copper-miners of the Lake Superior region. Their wages have been reduced, and they have accepted the cut without a murmur, because the price of copper has fallen 50 per cent. Moreover, the head of the American Federation of Labor cannot avoid the language and the arguments of a monopolist. Who but a monopolist would venture, at such a juncture, to say to the American people that, whatever their hardships, and however much their income might be reduced, he would not consent to share at all in the common privations, but would insist upon the highest price for what he had to sell? If the Beef Trust should take such a position, we should know what to think of it. Why should we have a different opinion of its arrogant defiance of public opinion when it is taken by a would-be Labor Trust? It is not probable that Mr. Gompers is really deceived by his own fallacies. As a sensible man, he must perfectly understand that it is impossible to single out the working classes as the only ones that shall not suffer in pocket and comfort at a time like this. We are all bound up together, and no class can claim immunity from the general misfortune. We have had our years of inflation, and are now confronted with the disagreeable but necessary process of liquidation. The high wages of labor will, in their turn, have to be liquidated.

The National Child Labor Committee, we are glad to note, has deemed it wise to give up for the present its demand for a Federal child labor law. The committee's decision last year to stake everything on getting a law through Congress was unfortunate; for the passage of such a measure would have discouraged State efforts for proper legislation, particularly in the South. Moreover, the value of the proposed Federal

inspection was more than doubtful, even had it been desirable to take another step toward centralizing power at Washington; and finally the choice of Senator Beveridge as the Congressional sponsor of the bill was a grievous blunder, since no student of political affairs takes the ever-youthful Senator from Indiana seriously. Now the National Child Labor Committee, on second thought, has made of the Federal inquiry into child labor, authorized on February 19 last, an excuse for suspending its activity on behalf of the Beveridge bill. It will, "for the present, take no further action with reference to national legislation until the results of the national investigation are available"; and will concentrate its efforts for the present upon State and local legislation and the attempt to secure a "Children's Bureau" in Washington.

A dispatch from New Haven states that the Yale "high livers" have got a bad blow in Dean Wright's report on scholarship. It appears that the wealthy students living in the expensive private dormitories are, in general, very poor scholars. For example, of the warnings for low scholarship given to sophomore classes between 1900 and 1903, 27 per cent. went to the rich boys in luxurious apartments, as against only 9 per cent. to those rooming on the campus. In view of this poor showing, the "high livers" are expected to be deeply dejected. But we are much mistaken if they are not, rather, elated. What does the Dean imagine they go to college for, anyway? To become pale-faced grubbers in books? Well, hardly. And to offset all the doleful figures about poor standing, they have another set which is a complete vindication of their course. Of the eighty men recently taken into the junior fraternities, seventy came from the dormitories with Persian apparatus, and only eight from the poverty-stricken rooms on the campus. The sooner our college authorities find out that in social advantages all the honor lies, the sooner they will show that they understand their Philistia.

If paper pledges are to count, the Central American Conference, which concluded its labors at Washington on Saturday, has accomplished more for peace in exactly one month than the august Hague assembly did in five. But amity and war have before followed each other so closely in Central America as to render an unrestrained optimism in the matter impossible. Yet the work of the Conference enjoys the better chances of survival because it does not attempt to bring about a sudden consolidation of five warring republics into a single state. Peace in the troubled Caribbean countries is to be established by the practical mode of reconciling and consolidating conflicting interests. The neutralization of Honduras is probably meant to save that country from being made a battle-ground between its quarrelsome neighbors on either side, Guatemala and Nicaragua; though the interposition of equally bellicose Salvador between the two republics does not entirely deprive them of the possibility of getting at each other. The institution of a permanent peace tribunal, with jurisdiction over all matters of contention, is welcome. Useful, too, are treaties providing for a system of extradition which should prevent the soil of one republic being made a recruiting ground for rebellion against another state; the development of a correlated system of higher education; the establishment of a Central American bureau of information; the harmonious adjustment of tariff schedules; and the development in common of means of transport and communication. In the "Fraternity of Central America" which was spontaneously created at a banquet to the delegates, and which consists of Mr. Root, Mr. Buchanan, the Mexican Ambassador at Washington, and the Mexican Forcign Minister, it is not impossible to discern an informal body of guarantors of the newly-concluded agreement.

English politics may be entering on a new phase, like our own. With the Irish question pressing threateningly, and with the Parliamentary programme for the next session yet unfixed, the Ministry can ill spare its chief. If Campbell-Bannerman's disability should be much prolonged it would almost certainly lead to a reconstruction of the Cabinet. It is true that enthusiastic Liberals are saying that they would prefer Sir Henry ill to any other Premier well, but that cannot last. Something of the same sort was said early in the last century, when Lord Liverpool was Prime Minister and fell ill. The result, however, was a break-up of the Ministry in a few months. That experience will almost surely be repeated now, if Campbell-Bannerman does not soon come back from Biarritz able-bodied. There has been some loose talk about keeping him on as a "Premier without a portfolio," but Sir Henry's hard sense would be the first to pronounce against the possibility of that.

A brief dispatch from Paris quotes unofficial authority for the conclusion of a treaty between the British and French governments providing for mutual assistance in the prevention of tax-dodging, especially with regard to inheritance duties and the income tax. This, if we are not in error, is quite a new phase of treaty-making. Extradition treaties we know, and conventions regulating the right of expatriation and the obligation of naturalized American subjects to military service in their native land, are, of course, common; but this is the first instance of the recreant capitalist's being placed on an equality with the forger and the assassin. The signatories to the new treaty have probably reasoned that capital, because of its very fluidity, must be dealt with in some such international fashion. So far as France is concerned, the treaty may be not unconnected with the proposed income tax law which has now been the subject of bitter discussion for over a year. A leading argument of the opponents of the measure has been that the Caillaux law—so called after its sponsor, the present Minister of Finance—will drive French capital across the frontiers. Within France there would be little chance for evasion, owing to the extensive inquisitorial powers conferred by the proposed law on the revenuo officials. French cartoonists have represented silver-haired old ladies with red-hot irons applied to the soles of their feet, or little boys of four confronted by three fiercely moustachioed gendarmes, one of whom is saying: "If you don't tell us where your papa has hidden his money, we will take away your little wooden horse."

What appeared to be a threatening situation in Natal a short time ago has been averted by the surrender of Dinizulu, who has been held responsible for a renewal of native unrest. The attitude of the Zulu king during the uprising of last year caused the British much uneasiness, since, without taking the field, he was suspected of having fomented the insurrection. It is lucky that hostilities were avoided. By the world at large, a second Zulu uprising within two years would have been taken as indicating a state of native affairs in Natal that called for more broad-minded dealing than the colonial authorities were willing to enter upon. The Zulus are notably warlike and insubordinate; yet after the terrible lesson of last year it would be something else than martial ardor that could impel them to take the field once more against mounted infantry and machine guns. Whether the hut tax that was the cause of last year's uprising is an unjust burden or not has been variously debated. But in any case prudence would dictate to the Natal authorities not to risk an upheaval that might easily spread over all of British South Africa. The newly constituted governments in the Transvaal and Orange River Colony have shown no disposition to embrace a liberal policy toward the natives, and the Imperial government has seen fit to reserve all future legislation on the subject for its own consideration, that is, for a possible Imperial veto.

A CLEAR FIELD.

President Roosevelt has screwed down the coffin of third-term hopes. By renewing with emphasis his statement of 1904, he has made it impossible for any man hereafter to talk about nominating him without insulting him. There will still be mutterings, of course, from exposed prophets and disappointed sycophants, but the thing is settled. The political field is cleared. For the first time in twelve years, a Republican National Convention will meet not simply to register a foregone conclusion.

This will at once lead to a great quickening of interest in the contest. The friends of various candidates will redouble their activity. General talk about availability will have to give way to actual demonstration of strength—strength both in popular sentiment and in ability to command practical support. This is the main reason why, in our judgment, the movement in favor of Gov. Hughes should immediately be given a new aspect. Thus far, it has been passive; taking note of the deep impression which he has made upon all parts of the country; observing the remarkable unanimity of States with favorite sons in making him second choice; waiting for the heavy hand of the President to be removed. But now it is time that active work were done by those well-wishers of the Republican party and of the nation who desire to see Mr. Hughes made the candidate for the Presidency.

On the barest grounds of political expediency his title might be urged. The Republicans are, in any case, going to have a hard row to hoe next year. They will have to encounter the argument of hard times. This is always formidable against the party in power; it will be doubly hard for the Republicans, after their record and their boasts, to overcome. Any one can see by the way in which Bryan's spirits are rising that he expects to harp next year upon the Republican panic and the Republican depression. Now, the only way to meet such tactics is, not to put forward a rival in harum-scarum shouting, but a man who has shown himself strong and cool and steady, and in whom the great mass of conservative people, doubtful about the past and timorous about the future, can be induced to repose their confidence.

Gov. Hughes seems, in fact, as if cut out by nature to be an after-panic nominee. He is progressive, but sure-footed. It is his illustration of slow-going but constructive reform, as against the hurricane variety, which has made people all over the land look to him as the type of mind and the style of executive which times of upheaval and uncertainty demand. It is clear and firm administration, with few but well-considered measures of new legislation, that Gov. Hughes has stood for; and only a programme along those lines can have any hope of winning against Bryan next year. Lord Cromer, in a recent speech, told a story to exemplify the two types of statesmanship:

> A conjurer exhibited in London some few years ago. He invited one of the audience to lend him his hat. He then, to all appearances, cut it into small pieces, and eventually, of course, gave it back to the owner uninjured. He then invited any one among the audience to do the same. A young officer of the army stepped on to the platform and said he would like to try. He borrowed a hat from a confiding old gentleman, and cut it into small pieces. Then he stepped down from the stage with the remark: "I can only do the cutting up part. I leave the rest to the professional conjurer." The owner of the hat was not altogether satisfied.

We have had too many public men in recent years who could only do "the cutting up part." The fragments, which prove their skill, lie all about. A man who can keep things whole is now pretty generally desiderated; and no one in sight fills the bill better than Gov. Hughes.

He himself, we make no manner of doubt, will refuse to be an active candidate. Sticking to his job, he will give himself wholly to the work of the office which he now holds. But as that originally gave him strength with the people, it will now only heighten it. But his friends will bestir themselves in his behalf, and the eyes of all Republicans will be turned to New York. The delegation of this State is likely to be for Hughes; and, with the strong prepossession in his favor in Pennsylvania, in Illinois, and in Indiana, there is good hope that the Empire State will again be able to give to the nation a great servant.

THE IRREPRESSIBLE TARIFF.

Already it is evident that those who think the tariff question can be put away in camphor until after the next Presidential election, are living in a fool's paradise. The thing will down at no man's bidding. It is not only tariff-reformers who insist upon keeping up the discussion. Tariff-bigots do the same thing. Last week in the Senate, resolutions were introduced by Senator Gallinger which were, in effect, an attack upon the Administration for having temporarily composed our tariff differences with Germany. It was done by mutual concessions. The German Government agreed not to apply its maximum duties to our exports, and in return we agreed to give up the vexatious and often outrageous marking up of the valuations of German invoices. But did anybody suppose that the Protective Tariff League would let such a reasonable adjustment pass without shrill protests? Foreign goods have been let into the sacred preserves; and so we see the President and Secretary of State denounced as traitors to the protectionist cause, and Senator Gallinger is put forward to make the fight for the whole-hog tariff. The spirit of the high protectionists is like that of the champions of slavery, who, just before it was about to fall forever, asserted with noble rage that it must not be attacked in any particular.

If the tariff beneficiaries and the protectionist fanatics will not let the question sleep, certainly reformers cannot fail to press home the truth at every opportunity. Never was the chance finer to strike against tariff injustice. By accident, the protectionists have been able to enlist on their side the superstition that a high tariff means prosperity. But now, by accident, that political argument, fallacious but effective, has been taken away from them. Depression has come with the tariff at its highest. Manufactures are crippled, men are being thrown out of work or having their wages cut down, with protection powerless to prevent it. The popular delusion on that subject should now be shattered irreparably; and the country should be ready to hear the truth with a more unbiassed mind.

Moreover, every door that a protectionist President would open by a crack, simply demands to be flung wide. Mr. Roosevelt came out for the removal of all duties on every forest-product. He would not only make white paper, but lumber, cheaper; and this on the incidental ground of the threatened exhaustion of our home supply. In forest products, however, we are not approaching an absolute limit, since we have millions of acres adapted to the growth of such products, and the science of forestry is rapidly advancing. But with coal and iron the case is different. Nature is not making new beds of coal to take the place of those which we are so rapidly using up. The same may be said of various other mineral products. Yet we get no word from the President urging the removal of tariff duties from the supplies from other countries. If the pulp of the newspaper could be made of coal, possibly he would have remembered the tariff on coal.

In his implied recommendation that the tariff on art be abolished, the President made another halting concession, where every consideration of logic and good sense should have carried him further. The tariff on books, scientific instruments, and other such aids to the progress of civilization is even more barbarous than the tariff on art. No one is better aware than the President of the absurdity and the positive injury of such duties, nor will his reasons for delay until after the Presidential election apply to them.

A pungent article in the Portland *Oregonian*, which has been a stout defender of Mr. Roosevelt, though it is for tar-

iff revision, shows how topic after topic in the President's message really led him up to the iniquities of the tariff, though he refrained from following the argument. The President dwells upon the evils of large and secret campaign contributions. But who have been the notorious corrupters of the suffrage through large gifts of money to politicians? Who but the tariff barons? President Roosevelt himself took their checks, and has thus far yielded to their demand that he leave untouched the tariff which they bought and paid for. The President talks much about "equalizing opportunity," yet what inequality is so gross as the privilege purchased by a few to enrich themselves, through tariff laws, at the expense of the many? Mr. Roosevelt opposes Socialism, yet nothing could do more to provoke an active socialistic movement than a law to make a government tax a means of private enrichment and oppression. The *Oregonian* sums up:

> The revision of the tariff is the greatest moral and economic issue before the nation to-day. The people demand it. Morality demands it. The obvious principles of justice demand it. Yet Mr. Roosevelt dismisses this supreme question in a paragraph.

One of the weaknesses of the President's gingerly treatment of the revision of the tariff is his implied view that any given duty is a vested right of its beneficiary. Hence no change must be made until after "due notice." Hence, also, the need of having the tariff revised only by its friends. But there is no reforming edge in all this. We do not wait to serve due notice upon a man who is picking our pockets. Nor do we leave it to highwaymen to revise their own code. In the present temper of the American people, the tariff as a vested wrong has a better chance of being considered on its demerits than for many years. Prophesiers of smooth things will urge that we keep quiet about it, or wait indefinitely, relying upon promises as false as dicer's oaths, but the issue is irrepressible.

SOUTHERN PEONAGE AND IMMIGRATION.

Southern disappointment at the obvious failure of the plan to bring into the South large numbers of foreign immigrants has been intensified by the recent report of Assistant Attorney-General Russell upon the subject of peonage. His statement of the facts as he found them is described as a deliberate conspiracy on the part of the Federal government to keep all foreign immigrants away from the South. To those of us who are used to hearing politicians lay upon our immigrants the blame for about all our national shortcomings, this complaint sounds almost comical. But in view of the open opposition of the Italian government to the settlement of Italians in the South and the recent blacklisting of Missouri and Mississippi by Austria and Hungary, it is not surprising that the South is wincing and that it should be inclined to call somebody to account.

It is not yet a year ago that certain States, notably South Carolina and Georgia, announced with a great flourish of trumpets that they were going to solve the labor and race problems by importing foreigners *en masse*. The arrival of a German steamship at Charleston with a cargo of immigrants was hailed as the beginning of a new era. Articles appeared all over the country condoling with the negro, or rejoicing over his certain economic extinction by the European invader. About the same time, however, the Italian government was sending representatives into the Southern States to see for themselves the conditions under which expatriated citizens lived. As a result of these investigations, the government threw its entire weight against recruiting for the South, and particularly for "colonies." Especially in Louisiana it found that the plight of the Italian laborers was unfortunate. It cannot, of course, dictate where any individual shall settle; it can, however, throw its influence in any given direction by means of its inspectors and the government officer who accompanies every steamer bearing Italian emigrants.

It was not only that there were some colonies or groups of Italians whose situation bordered on peonage, but that the general conditions of life were unfavorable. In some places the "dagoes" were regarded as about on a par with "niggers," and the treatment of them corresponded. Again, in Mississippi and Arkansas particularly, the absence of good food, of good roads, and efficient schools, together with the lack of all the amenities of life which go to make the existence of the very poor in Italy full of color, music, and variety, gave so cheerless an impression that the Italian government was bound to discourage its citizens from going to these States. Then came Secretary Bonaparte's chilling decision that a State could import immigrants, but could not guarantee them work. And when Mr. Russell came along and reported that the laws of the Southern States are used in various ways "to uphold peonage and other kinds of involuntary servitude," he was naturally denounced for this, and for urging that these statutes be amended "so as to be harmless for the purpose of enslaving workmen." This was the last straw.

Naturally, Southern newspapers have resorted to the *tu quoque*. The Charleston *News and Courier* wants to know why the North does not stamp out the "infamous 'white slave' trade, a traffic restricted to Northern cities." The New Orleans *Times-Democrat* avers that there are Italians working on the Northern Pacific Railroad under padrones, and "dimly remembers" to have read some serious strictures on the padrone system. The New Orleans *Picayune* rages for nearly two columns against the use of the whole Federal government to discredit the South, but gets consolation by suddenly discovering that the South does not want to get low foreign hordes at all; that "God is good to the South," and that in the long run the foreigners will soon displace the native-born Northerners, who will then seek refuge in the South!

Instead of formulating such fantastic theories, the statesmanlike way is for the South to rid itself of peonage; to put the North, with its "white slave" trade, to shame by making impossible within its borders any human slavery. Finally, the South might ascertain precisely the reasons which compelled the Italian government to its decision, and then clean house so thoroughly that hereafter those objections would be removed.

The truth is that the South is now paying for its failure to treat its own labor supply well. Too small this supply is, and often too inefficient. But there is only one method of making labor efficient, and that is by making it content and intelligent. Nothing is so wasteful as unwilling labor, whether of slave or peon. The lash never produced in the South the efficiency of its workmen of to-day, inspired as they are by self-interest. If this labor is to become more effective, it can only be made so by being given better opportunities, greater freedom, the protection of the laws, and—above all—a share in the government. The trained Italian observers cannot have failed to note that in a professed republic thousands of its citizens are deprived of the ballot because of their color, are at the mercy of lynch law, and, being poor and powerless, are in many communities being pushed downwards instead of being helped upwards. Is it surprising that Italy thinks the South has not yet learned how to treat workingmen properly? It avails not to reproach the North for its manifest sins; that will bring no more labor South. As the Pittsburgh *Dispatch* puts it, "the South will never come into its own industrially and economically until every vestige of slavery is removed from it."

MACEDONIA.

The assassination of Boris Sarafoff, the most noted Bulgarian champion of Macedonian freedom, by a supposed fellow-revolutionist, is typical of the cruel complex of factors that has made the pacification of Macedonia so desperate a problem. Macedonia is not Armenia. The comparatively simple situation of a Christian populace subjected to Otto-

man misgovernment and persecution is not duplicated in the Balkan peninsula. For the last five years, Macedonia has been made a land of massacre and pillage, not by contending Turkish and Christian forces, but by bands representing the various Christian nationalities in the peninsula. It has been Bulgarian, Greek, and Servian, pitted against each other far more often than against the Turk, to whom the monstrously anomalous conditions have greatly appealed, and for obvious reasons. To divide and rule has been the historical method of the despot. But few despots in history have been so fortunate as Abdul Hamid II. in being spared the necessity even of sowing dissension among their enemies. That work has been done for the Turks by the jealousies of the European Powers and the fierce hatreds that hold apart the Balkan nations. If sanguinary strife is to prevail not only between race and race, but between individual leaders in the same camp, as the murder of Sarafoff attests, it is apparent that the Porte has no cause for immediate worry.

The present difficulties date from the Macedonian revolution of 1903. The intervention of the Powers brought about a cessation of hostilities in November of that year, after 15,000 Bulgarians had perished in the course of some seven months' fighting. Russia and Austria, as the mandatories of the European Concert, imposed on the Turkish government the so-called Mürzsteg programme, providing, among other things, for the appointment of two civil agents in attendance upon the Turkish inspector-general, Hilmi Pasha, in order to study conditions in the three Macedonian vilayets, and to report thereon to their respective governments; the reorganization of the gendarmerie under a foreign general in the service of the Turkish government, to whom other European officers should be attached; and, when peace had been reëstablished, the redistribution of the administrative divisions in the three vilayets, "with a view to a more regular grouping of the various nationalities." Of these reforms the first two have been formally introduced, but allowed to remain practically ineffective, while the third has become a force for actual and serious harm. The civil agents have sent voluminous reports to their governments, the foreign police officers have been paid their stipends and kept sedulously away from everything in the nature of police work, and the promised "redistribution" of racial frontiers has set the Bulgarians, the Greeks, and the Servians at each others' throats.

Just why such internecine warfare should have resulted, is clearly enough indicated in the joint note on Macedonia addressed to the Powers by Russia and Austria on September 28 last. After quoting the terms of the Mürzsteg programme with regard to the future rearrangement of the Macedonian administrative divisions, it declares:

> The revolutionary committees have abandoned their struggle against the Ottoman government, and entered upon a course of racial warfare, with the apparent design of extending, each nationality for itself, its own sphere of influence, in order that such extension, factitious though it may be, and most often carried through by force rather than by the free will of the inhabitants, might serve as the basis for a future delimitation which would take into account the formal announcement by any element of the population of its sympathies as Bulgarian, Servian, or Greek.

To prove the nullity of such efforts at conquest, the Austro-Russian mandatories assert that no territorial delimitation will take place in Macedonia until the complete cessation of guerrilla activity and the thorough pacification of the country; that such delimitation would be in no sense a repartition of Macedonia into national spheres, but merely a readjustment of administrative geographical units of altogether secondary importance, and that in any case such delimitation would absolutely leave out of account the changes in the racial sympathies of the inhabitants effected by the activity of the guerrilla bands. To this statement the Balkan governments have presented the inevitable diplomatic reply. Servia regretted the deplorable state of affairs in Macedonia, but begged to point out that Bulgarian bands had been in the field before the announcement of the Mürzsteg programme in 1903, and that the Servian population had been driven to take up arms in self-defence. Greece begged to express its appreciation of the "lofty sense of equity" that animated the mandatory powers, but wished to state that the Bulgarian bands had begun to war against the Greek element in Macedonia as early as 1897. Bulgaria could not forget the fact that the great bulk of the people of Macedonia is Bulgarian. And there the matter rests.

The truth is that responsibility for the present chaos rests on Greeks, Bulgarians, and Servians alike. Five years of sanguinary conflict have served to obscure the question of initial right and wrong. Each party can now point to its martyrs. The only undisputed fact is that the people of Macedonia almost alone pay the awful cost. Competent observers declare that the years of the "Reform" have been far worse than the years of the "Insurrection." That hurricane of repression slew its thousands; the "Reform" is slaying its tens of thousands. According to Sir Edward Grey, two hundred murders a month—promiscuous murder, of men, women, and children—is the average, and that is declared to be rather an underestimate. In the vilayet of Monastir the murders in 1906 numbered eleven hundred. In the vilayet of Kossovo it was somewhat less. C. F. G. Masterman, an English M.P., writes to the London *Nation* from personal observation:

> Parts of Russia may reveal some similar statistics; but there the innocent are mostly left alone, or only killed by accident. Revolutionaries kill officials, and are killed by them. But in Macedonia it is rarely the guilty who suffer. The harmless peasant working in the fields, his wife and sleeping children, form the staple material of the massacred. If a band kills a Turk there will be reprisals. If an Exarchist village is converted—by murder—to the Patriarchal supremacy, it is very sure that retaliation will follow. But the reprisals will descend promiscuously upon any peasants who happen to provide material for slaughter, and the "conversion" will probably operate on a community who know nothing of the causes of their disturbance.

No other remedy suggests itself but the institution of a force of gendarmerie that shall be European throughout, and free to act on its own initiative, as the present police officers are not. Pressure must be exerted on the two mandatory Powers. The guardians should be guarded in turn. To expect the warring Balkan nationalities to lay down their arms voluntarily is vain. In the first place, too much blood has already been shed to permit a speedy reconciliation of differences. In the second place, the Balkan governments are apparently convinced that, in spite of protestations to the contrary, any repartition of Turkish territory will be accomplished only on the basis of the *status quo*, and that with the prevailing cheapness of life in the Balkans, it is a good policy to face the future with the *fait accompli* as much as possible in one's favor. Such hopes lead Greek merchants to send lavish patriotic contributions from every part of the world, and impel the Bulgarian government to "wink" at the activity of its numerous bands. Guerrilla chaos as a policy in Macedonia has the supposed double advantage of hastening the end of the Turk and advancing the cause of a particular nationality.

A NEW ERA FOR THE CONGO.

The Belgian Parliamentary Commission which has in hand the drafting of a colonial bill has not quite finished its labors, but already we know the main provisions of the measure that is to terminate Leopold's misrule in the Congo. Briefly stated, the problem of the Congo for the last year or more has been whether the personal influence of Leopold II. was to continue paramount even after the annexation of the state by Belgium, or whether the new régime should be one of Parliamentary control in fact as well as in name. In England, where the Congo reform agitation practically has its home, there was, up to a very short time ago, a tendency to distrust the motives of the Belgian King and of the majority in the Parliamen-

tary Commission. Driven by outraged public opinion to make concessions in one direction, King Leopold was represented as seeking to perpetuate his malign influence in other directions. He was, for example, accused of ceding to private companies, in which he was interested, the whole of the Domain of the Crown, on conditions that would render that vast section of the Congo practically independent of Belgian control. That story has been shown to be more or less false, and, on the whole, the Belgian King, during these last few months, has not been given his entire due.

On this subject we may note a remarkable change in English public opinion within the last few weeks. As late as November 7 the London *Times*, which has been an uncompromising critic of conditions in the Congo, published a solemn appeal to the nation, signed, among others, by the Archbishop of Canterbury, Sir Harry Johnston, Sir Charles W. Dilke, and the Lord-Mayors of Glasgow, Liverpool, Manchester, York, Newcastle, and Sheffield. The appeal enumerated the oft-repeated charges against the system of King Leopold, and then went on to criticise the inadequacy of the measures contemplated by the Belgian Parliament:

> The proposals of the Belgian government are now seen (by the Colonial Law) to leave the present system unchanged in all its vital features, with no check at all upon autocratic control in so far as native administration is concerned; and a majority on the Parliamentary Commission charged with the examination of these proposals has been found willing to concede to autocracy what autocracy required above all—financial control. . . . These and other measures would appear to indicate the grave peril that Belgium may be formally committed to such a course as may be disastrous to the supreme human issues at stake, and make it impossible in the opinion of the signatories for our government to acquiesce in what is taking place.

Only twelve days after the publication of the appeal, the Brussels correspondent of the *Times*, whose dispatches had been as uniformly severe in tone as the words we have quoted, telegraphed that, while it was still "possible that certain modifications may be introduced on the second reading, taken as a whole, the bill as it now stands represents a remarkable triumph of the party which has been fighting the battle of Parliamentary control versus absolutism. When it passes into law, Parliament will have the right to intervene in any matter relating to the colony."

The Belgian colonial bill, like every other document, is, of course, subject to varying interpretation. And, according as one is or is not willing to credit the Belgian Parliamentary majority with good faith in the task it is now engaged upon, the estimate of the ultimate benefit of the bill will differ. Just how wide a difference the initial point of view may bring about appears when we turn to the remarks on the colonial bill by E. D. Morel, published together with the text of the bill in the "Official Organ of the Congo Reform Association." The vital portion of the bill is contained in Article II., which declares that the legislative power in the colonial possessions of Belgium is exercised by the King in the forms specified within the bill; Article III., which declares that power is exercised by decrees, issued with certain exceptions when the Cabinet has charge, by the Colonial Minister; and Article V., which declares that no act of the King can have effect unless countersigned by the Minister, who by that alone makes himself responsible. On these articles Mr. Morel comments: "From the above it will be seen that the legislative and executive power is just as wholly in the King's hands as it was before." Whereas the *Times* correspondent is of the opinion that "by this clause [Article V.] the Belgian Chamber obtains similar powers to those exercised by the House of Commons."

Indubitably, the bill contains features which might have been replaced by more radical provisions. Such, for instance, is Article VIII., which leaves the annual budget still to be drawn up by the King. Nevertheless, he does not retain absolute financial control. The same clause provides that the salary of the Colonial Minister and the expenses of the central colonial administration in Belgium form a special budget which will be submitted every year to the vote of the Chambers. Parliament is thereby given the power to interpellate the Minister on the entire sphere of colonial administration, and, in case of sharp conflict, to refuse to vote supplies for carrying on colonial administration in Brussels. A Colonial Minister and a Colonial Council might conceivably hold out after supplies had been refused by Parliament; but even Leopold II. would hesitate before entering on a constitutional conflict with his Chambers. Finally, the King's control over finances is further limited by the important proviso that "decrees authorizing loans chargeable to or guaranteed by the colony, and works to be paid for out of extraordinary resources, shall be issued only on the proposal of the Ministers in council." On the whole, then, the near beginning of a brighter era in the Congo may be expected.

One great question, however, still awaits solution at the hands of the Belgian Parliament before the Congo can be regarded as a modern colony. The problem was well stated in a note by Sir Harry Johnston appended to the appeal from which we have quoted:

> The thesis at the back of the present system, viz., that the ownership of all the commercial resources and produce of the Congo above Stanley Pool is and remains vested in individuals residing in Europe, must find no place in any future scheme of administration.

That is a just position to take, and it is for the Belgian people, now that it is about to obtain control of the Congo, to show that the old evils will not be perpetuated. Royal extortion or Parliamentary extortion—to the natives of the Congo the process under any name would remain just as unpleasant.

THE PLEASANT PRACTICE OF READING ALOUD.

"The pleasant practice of reading aloud," says a recent writer, "is one that is now falling into disuse." It is easy to adduce reasons why. For one thing, we are in too much of a hurry. He is a true child of the present day, that Columbia professor who maintains that to read a book through is to exhibit a touching and commonly misplaced confidence in the author. From most books, our learned friend declares, you can get all that is worth while by turning the leaves pretty rapidly and, so to speak, eating out the heart. This skeptic would doubtless maintain that to spend time reading the book through aloud is reckless extravagance; and to that view many other persons must assent. Our *a priori* argument as to why the pleasant practice should decline is fortified by the testimony of a Harvard expert, who some fifteen years ago used to talk to freshmen about "The Obsolescent Art of Reading Aloud." Presumably, his conclusions were the result of exhaustive research, after the most approved manner of modern scholarship; and if his protests have not arrested the evil tendency we may believe that by 1907 the art is entirely obsolete in and around Cambridge. But in less enlightened and progressive parts of the country—the intellectual backwaters—the custom may still linger, a survival of an age of leisure and of child-like faith in authors. Stevenson tells of a Welsh blacksmith who at the age of twenty-five could neither read nor write. But when he heard a chapter of "Robinson Crusoe" read aloud in a farm kitchen, he "painfully learned to read Welsh and returned to borrow the book." It had been lost, and he could find only a copy in English; yet so strong was the spell that had been cast upon him, that down he sat once more and learned English. We may match this with a passage from Lang's "Letters to Dead Authors":

> I know that in a remote and even Pictish part of this kingdom, a rural household, humble and under the shadow of a sorrow inevitably approaching, has found in "David Copperfield" oblivion of winter, of sorrow, and of sickness.

The Welsh blacksmith and the Scottish family we may take as types. There are persons of far more abundant æsthetic resources who nevertheless share

their simple tastes and prefer to prolong the enjoyment of a good book, to sip it rather than swallow it at a gulp.

And in spite of our deference to the authority of the Columbia pundit, we hold that there are plenty of books to be sipped. History, we confess, is likely to prove rather a stiff dose. We all remember how in "Alice in Wonderland" the Mouse offered to the wet animals the driest thing he knew:

> William the Conqueror, whose cause was favored by the Pope, was soon submitted to by the English, who wanted leaders, and who had been of late much accustomed to usurpation and conquest. Edwin and Morcar, the earls of Mercia and Northumbria—

But this is not to say that Macaulay in the mouth of the right reader would not hold the attention of an intelligent listener through the whole five volumes. For the most part, however, the books for the living voice are essays, letters, diaries, biography, fiction, and poetry. In prose the choice would commonly fall on the writing that is relieved by touches of humor. For essays our own selection—though we have space for but few names—would be first those of Lamb and Hazlitt. Irving, too, is always happy, even if somewhat tenuous. Of their modern disciples we prefer Thackeray of the "Roundabout Papers," Alexander Smith, and Stevenson, and—*longo intervallo*—Lang and Augustine Birrell. In the graver vein there is Newman in the "Apologia," "The Idea of a University," "Essays Critical and Historical," and "Historical Sketches." His sentences fall on the ear with singular charm and persuasiveness. Matthew Arnold, particularly in "Culture and Anarchy," "Friendship's Garland," and the two series of "Essays in Criticism," is steadily entertaining; and so are Walter Bagehot and Leslie Stephen; and so, too, is Huxley, whose merits as a stylist are hardly yet appreciated. From Arnold and Huxley it is a short step to the book which occupied so much of their thought, the Bible. The best of this, as we have said before, is the best there is. The Bible and the "Imitation" respond to our more serious moods with unmatched aptness and eloquence.

In letters, diaries, biography, and fiction it is safe to pick out almost any of the old favorites: the letters of Swift to Stella, of Lady Mary Wortley Montagu, Cowper, Byron, Shelley, Lamb, and so on down to Stevenson; the diary of Fanny Burney; Boswell's Johnson, Lockhart's "Life of Scott," Trevelyan's Macaulay; and all the good novels. First on the list are the novels of clever characterization and vivacious dialogue; and in this class nothing is better for reading aloud than Jane Austen, so animated and witty that even her bores are amusing. Quite at the other pole stands Wilkie Collins, his characters mere empty masks, his dialogue a machine for unravelling the mystery, his stories, in short, devoid of graces of style and offering us the interest of plot at almost its lowest terms. Yet we have seen a set of Wilkie Collins with faint pencilled memoranda, like the following, at the beginning and the end of nearly every one of the thirty volumes:

> Dear Helen commenced reading this wonderful tale Saturday, 7 P. M., April 27, 1895.
>
> My dear Helen finished this story Monday evening, May 6, 1895.

The hand is feeble and uncertain, like that of age or infirmity; and not long after the date of the last entry the books were offered at auction. Who "My dear Helen" was and who her eager listener, and why the reading stopped, we shall never know; but we may guess that Collins, as well as Dickens, has brought forgetfulness of pain, and perhaps even happiness under the shadow of the inevitably approaching end.

As for poetry, reading aloud is the only way. The difference between poetry read thus and read to one's self is the difference between hearing music played and quietly studying the score. The rhythm and the rhyme, the pomp and movement of the verse, lose half their effect without the interpretation of the voice. Indeed, the only poetry that we make our own, the poetry whose cadences cling in the memory, is that which we have read aloud or heard read; its imagery is ever visible to the inner eye, its melody dwells in the inner ear. And this perhaps is one reason why the books read aloud to us in childhood make so deep an impression and so profoundly affect our taste. It is not merely that our senses are unworn and tender; it is that the sound itself has reinforced the idea. The hymns we sang in Sunday-school, the poetry of the school reader, the declamations of Friday afternoon—for many of us these have set once for all the standard of literary excellence. And age and experience and wide ranging through many famous volumes can never bring us back to that high-water mark of pleasure in books.

PARIS BOOK NOTES.

PARIS, December 6.

There are a few gleanings to be made among late autumn books, before the holiday season sweeps all away with its flood of commonplace. As usual the Revolution, or something directly preceding or following it, furnishes matter the most fruitful and piquant. Frantz Funck-Brentano finally expands his original researches in historic French outlawry into a notable volume on Mandrin, the captain-general of the "contrebandiers de France." The names of Mandrin and of Cartouche long since entered into popular legend in France, like those of Jonathan Wild and Claude Duval in England. The real story of the man, with his six expeditions laughing at the King's taxes and customs all along the Dauphiné frontier, is here brought down to sober history from the complete and often new and unpublished documents in the case. It shows better than many theoretic essays the fundamental disorganization of the Old Régime, and helps to explain away what still seems the miraculous explosion of the Revolution. François Vincent Toussaint's contemporary "Anecdotes curieuses de la cour de France sous le règne de Louis XV." were published expensively in their original text, with plates some years ago; they are now reprinted in a popular edition, with notes by Paul Fould. To the wise man—*verbum sap sapienti*—they offer further explanations of the downfall of all monarchy and nobility in France. "La Comtesse de Mirabeau (1752-1800)," written from unpublished documents, by Dauphin Meunier, has more solid interest from the overshadowing personality of the popular tribune whose life, private and public, was an enormous tragedy to her as well as to King and people. "François Buzot (1760-1794)," by Jacques Hérissay, tells also for the first time completely the tragic history of the Girondin lover of Madame Roland. Readers of Lamartine, who had more literature than documentary history, will be glad to rectify their acquaintance with truth, which is indeed more heart-rending than legend. Two industrious book compilers, A. Savine and Fr. Bournand, open the new "Collection historique illustrée" with a volume on "Le 9 Thermidor," from documents of archives and memoirs. It gives in popular form, and at first hand, an account of the fall of Robespierre and the end of the Terror, without passing over the women in the event. "La Police sécrète du Premier Empire," made up of the daily bulletins presented by Fouché to Napoleon during the years 1804-5, now appears in the light of day, edited by Ernest d'Hauterive.

The transition from universal revolution in government, laws, and manners, to its inevitable consequence in letters is marked in a very competent book by a young writer, whom previous works in literary history have accredited—"Charles Nodier et le groupe romantique," by Michel Salomon. When the boy Nodier begs the life of a lady from his revolutionary father, we see that guillotining also went by influence in the first days of universal suffrage; and with Victor Hugo and the rest of the grown man's company we see the genesis of the new literature. "Coleridge," by Joseph Aynard, covers the same period of history in the career of a man infinitely more important to English thought, and, through Englishmen, to the world. The book is one of those French university theses which turn into a masterful literary work. It is doubtful if any English writer has undertaken so complete and disinterested a view of the many-sided man who started flowing so many revolutionary streams in English literature and philosophy—and in theology most of all. M. Aynard considers him as a poet and as the first English *Romantique*; as a receptive thinker reflecting all the intellectual movements of the French Revolution and Empire; and as the initiator (under German influence) of religious evolution in England (and America) before the Oxford movement.

Taking a great leap forward in political history, we have another university thesis, which forms a substantial work of history in a field of more than technical interest,

because it is connected with the whole European policy of France until the fall of the Second Empire, and is still hotly disputed—"Lamartine et la politique étrangère de la Révolution de Février (24 Février—24 Juin, 1848)," by Pierre Quentin-Bauchart. "'70-'71. Nouvelles feuilles de route" continues Paul Déroulède's recital of his experiences in the Franco-Prussian war, from his escape from the fortress prison at Breslau to his junction with the provisional government at Bordeaux. His burning patriotism has since led the author into many troubles with a republic which is not his kind, but it only lends to the poignant interest of his narrative and sheds light on history in the making, of which we have not yet the ultimate result.

A book of solely personal histories under many régimes is "Quelques figures de femmes aimantes ou malheureuses," by that pleasant writer Téodor de Wyzewa. He communicates to the reader the thrill of his stories of queens, *grandes dames et bourgeoises*, authors' wives and *femmes de lettres;* and, separately, he presents two whose lives were tragedies.

A final book in French history has for its subject one whom the mind easily projects from his own time into the future revolution of ideas. It is the second part of "Pascal et son temps," by Prof. Fortunat Strowski of Bordeaux. The importance of the work has already been noted; this volume deals with the history of Pascal himself. The same essential subject present through all the centuries, that which alone makes Pascal of any general interest nowadays, is treated in a far different epoch, didactically and as a sober historian, by the Abbé Duchesne in the second volume of his "Histoire ancienne de l'église." It covers the period from the coming of Diocletian to the death of Theodosius, a period which had been discussed notably by the older French historian, Albert de Broglie. The texts on which the history rests are here treated at first hand, as might be expected from a cleric whose reputation has been sufficient to place him and retain him at the head of the French Classical School of Rome under the Third Republic. His frank impartiality has not prevented the Roman *imprimatur*, even after the condemnation of "Modernism"; and it will surprise only those who do not know the essential position of the Papacy in history to read here that, in the fourth century, "there was not yet a direct power, an efficacious expression of Christian unity."

A last book, perhaps the most interesting for the general public, does not concern history directly, but, rather, the reasoning of one historian in particular. The historian is Taine, whose writings have done so much to wean Frenchmen from their indiscriminate admiration of their Revolution. The critic is Alphonse Aulard, whom the Radical Socialists of the Paris Municipal Council endowed with a chair of revolutionary history at the Sorbonne—for the perpetual refutation of Taine. As this has been practically the only course on French history open to strangers, wandering English and American students are heard to say that their Paris University lectures have taught them not the history of France, but that Taine was a wretched historian of Franee. M. Aulard is strong in documents; but the application of logic to history is something else, and it remains to be seen if M. Aulard's logic is the more authentic of the two. He does not accuse Taine of intentional misrepresentation, but of a constitutional and philosophical organization of intellect rendering him incapable of perceiving the true glories of French democracy in its guillotining age.

Frédéric Masson, the *enfant terrible* of Napoleonic documents, has noted during the past week a most curious lapse on the part of several generations of documentary historians with regard to the interpretation of a simple fact, whose meaning since it was official should have been easily ascertainable. Nearly fifty years after the event, Thiers wrote that Napoleon, at his coronation, deliberately snatched the crown from the hands of the surprised Pope and clapped it on his own head. This, under various forms, has been repeated without question down to the latest volume in the accredited history of France, edited by Professor Lavisse. M. Masson declares that the fact of Napoleon placing the crown on his own head and afterwards crowning Josephine with his own hand, had been arranged beforehand, in absolute agreement with the Pope and the master of ceremonies of the occasion. Padre Renieri has found the original protocol in the Vatican archives; and M. Masson has the French documents showing that the ceremony was intended on all sides to mean that the Emperor received the crown, not from the Pope, but from *dignitaires* representing the French people. M. Masson points out that for fifty years no one dreamed of Thiers's interpretation, which seems to have been founded on a suspicion of his own, due to imperfect acquaintance with the circumstances of the fact he was narrating. But M. Masson adds with a skepticism bred of long experience, "I have no hope of seeing future historical writers abandon Thiers's version!"

S. D.

NEWS FOR BIBLIOPHILES.

And now it is Earl Howe who is selling his Shakespeares. His set of the four folios and a large collection of quartos, some of extreme rarity, is to be sold by Sotheby, Wilkinson & Hodge, London, December 21. The twenty-eight genuine quartos include "Hamlet," 1604, second edition, only three copies known; "Hamlet," 1611; "Henry IV.," 1613; "Henry V.," 1608; "Richard, Duke of Yorke" (Henry IV., part iii.), 1600; "King Lear," 1608; "Richard II.," 1598; "Richard III.," 1597, only two perfect copies known; "Merchant of Venice," J. Roberts, 1600; "Merry Wives of Windsor," 1619; "Midsummer Night's Dream," James Roberts, 1600; "Pericles," 1609; "Romeo and Juliet," 1599; and "Titus Andronicus," 1611. The earl's first folio is perfect, that is, no leaves are lacking; but the leaf of verses and title are backed, some margins of several leaves are mended, and some few letters of print are injured. In size it is large, measuring 13 by 8¼ inches. It was No. 22 of Lee's "Census." In Sotheby's sale of December 12 to 14 was a copy of Mrs. Browning's first book, "The Battle of Marathon," published by her father, in an edition of fifty copies, when the author was thirteen years old. This brings the list of known copies to seven, of which five are in the United States. Sotheby's catalogue says that only one copy has ever been sold at auction and refers to C. B. Foote's copy (now Mr. White's), which brought $330 in 1895. There are, however, two other records of sale. William Harris Arnold's copy (presented by the author to S. M. Barrett) brought $425, May, 1901; and A. J. Morgan's, $410, April, 1902. The other two copies in America were both presented. One, given by the author to Miss Trepsack, the old family nurse, known in the Barrett family as "Treppy," belongs to F. R. Halsey; and the Rowfant copy, which contains an inscription, from which the name of the recipient has been partly erased, is owned by J. A. Spoor of Chicago.

The fine Dormer-Hunter copy of the First Folio (No. 13 of Lee's list), has again changed hands, and is now offered, with the Second, Third, and Fourth Folios, by Dodd, Mead & Co. They have printed a pamphlet describing the set; and in it they endeavor to locate known perfect copies, "perfect" being used as by Lee to mean only that no leaves are lacking. They trace twenty in this country, of which five are in public libraries and fifteen in private hands. To this list at least one more can be added, making sixteen in private hands in America. F. K. Trowbridge of New York has a perfect copy, which he secured from J. Pearson & Co. of London, through George H. Richmond, about 1902. This was Lee's No. 147, and measures 12 3-16 by 7⅞ inches. Mr. Trowbridge also owns two perfect copies of the Second Folio (one with the rare Smethwick imprint), and fine copies of the Third and Fourth Folios, as well as several early quartos.

On December 16 and 17, the Anderson Auction Company sells a collection which is in part selections from the library of H. M. Schroeter of Los Angeles, Cal. There are no less than fifty editions of Omar Khayyám, also a number of publications of the Grolier Club, items of Americana, and first editions of Emerson and Bret Harte.

The collection of autographs and manuscripts formed by George M. Williamson of Grand View-on-Hudson, was dispersed by the Anderson Auction Co. of this city, in March, 1904. The same firm will sell his library of first editions in February next. Among books by American authors, the Hawthornes have probably been his greatest pride. The list includes "Fanshawe," 1828, Hawthorne's first book; "Peter Parley's Universal History," 1837, issued anonymously; "The Gentle Boy," 1839; "Grandfather's Chair," "Famous Old People," and "The Liberty Tree," all 1841; and "The Celestial Railroad," 1843; as well as the more common books. The Lowell items include the "Class Poem," 1838; "A Year's Life," 1841; "Conversations on Some of the Old Poets," 1845; and the rarer and more valuable "Commemoration Ode," 1865, the copy given by Lowell to Bigelow, the printer. The Holmes and Longfellow collections are extensive and include presentation copies. There are few Bryant or Whittier items, but among books of the former author is the copy of "The Fountain" which Bryant gave to Charles Dickens; and among those by the latter is the rare "Mogg Megone," 1836. Of books by English authors the Dickens collection is most notable, containing one of the finest sets of "Pickwick Papers" in parts, which

has ever been offered for sale; and the "Sketches by Boz," the first one-volume edition, 1839, also in parts. The George Eliot and Brontë collections are practically complete, the Brontë "Poems" of 1846 being the rare first issue, with the imprint of Aylott & Jones. Another author in whom Mr. Williamson was especially interested is Lewis Carroll, of whose writings there are more than fifty items. A number of unusual and little-known leaflets, some with autograph annotations, were secured from the author's own library when it was sold after his death. The valuable item is, of course, the "Alice in Wonderland," the genuine first edition, with title-page dated 1865. The story that owing to the poor impressions of the illustrations, the entire edition was withdrawn from sale and distributed among London hospitals has probably no foundation in fact. What actually happened was that the first edition was purchased for the American market by D. Appleton & Co., who cut out the original 1865 English title-page and pasted on its stub a New York title-page with their name and the date 1866. The type was at once newly set for a second English edition, dated 1866, copies of which are bought and sold as the first edition. Mr. Williamson's copy, the author's own, is one of five or six known with the original title of 1865.

Correspondence.

THE ELECTIVE SYSTEM.

To the Editor of The Nation:

Sir: Now that the elective system, however modified from its early excess, seems likely to be an actuality for many decades to come, it enters the category of those things with which one must reckon as facts, must somehow get along with. It has not, of course, established itself beside such fundamentals as the need of discipline and the like; but at its worst and weakest it stands as the temporarily accepted system. Men are prone to make the best of the inevitable, and it is the part of philosophy to seek for comfort even in the direst straits. The present outlook is far from dire, and a good deal of comfort, of one kind and another, can be extracted from it. One of the most scornful cries of those who clung to the old required curriculum was that choice was being placed in the hands of callow and frivolous youth, whereas it belonged, as of right, to experience and age. We are now in a position to ask whether there are not certain present or prospective beneficial results from the according of such choice; in other words, whether the exercise of choice does not present other aspects than, on the one hand, an added freedom for the pursuit of congenial or practical aims, and on the other, a laughable or demoralizing evasion of knowledge. Such freedom is naturally abused at first, and, perhaps, rather widely; and, by very reason of its newness and strangeness, it is, though in good faith, used unwisely. The power of choosing needs education, like any other. It is said that the student is incapable of choosing for himself—but a reasonable reply would be, that he has not yet had the chance to demonstrate either ability or disability.

If results are not yet apparent, however, after some years of the system, they should be at least defining themselves, albeit, perhaps, uncertainly. Convincing demonstration is, of course, impossible at present, for the whole matter is as yet mainly one of opinion and assertion, rather than of proof. But among observers, it is the opinion of a respectable minority that the exercise of freedom on the part of the student has been beneficial to himself and also to the teaching body. It is believed that the student is attracted by courses which have worth, although it is freely admitted that, like the rest of untutored and much of educated humanity, he naturally moves in the line of least resistance, until the value of other lines is demonstrated to him to be worth the extra effort. Again, it is thought that no small portion of the advancement in efficiency on the part of collegiate instruction, is referable to the bracing effects of a legitimate competition.

The conviction that students are not content with what is of no value is based upon the observation that they do not, as a rule, flock into easy courses when these are also dull or useless. They at least persuade themselves that, as they say, they "are getting something for their money"—any other view would be self-stultification in even the student mind. What few there are, and however conspicuous these may be, who select courses purely for their easiness, would possibly have been forced to get more under the old prescribed system; but the aim and trend of education should not be plotted in terms of such ordinates. Again, it should be borne in mind that there are other qualities about a course, and the man who gives it, than so many lines or propositions per diem, and so much police duty done. What is difficult, because obscure and whimsical, in the hands of one man, may be called easy in those of another. One famous professor used to get his students highly worked up over the shilling of the Massachusetts Bay Colony, its assay and its vicissitudes. The best teacher will not be the easiest, perhaps, but he will tend to appear easier than a less competent one, because he will enlist more—and more kinds of—curiosity and mental activity. The same thing applies to subjects: the subject that students want to hear and know about, which seizes their imagination or otherwise stimulates them, will appear easier than one which, though actually less difficult, is dry, repellent, and unhuman. Again, the time at which a subject is taken up, and its newness, may determine its popularity. Greek begun at eighteen or twenty might appeal to many to whose youthful and short-seeing minds the paradigms alone have appeared typical of the whole; even *hoti* might be tolerated if it did not occupy the whole perspective. Men who have done poorly upon subjects begun too early and robbed of their vitality, not infrequently do well upon new ones, where they are no longer under such a handicap. The work of some students, up to that time mediocre or poor, has presented a remarkable metamorphosis in senior year. Under the elective system it appears that the student is not so eager to shirk as he was in the past, though, of course, some of this difference may be due to betterment of instruction all along the line; older professors and persons whose duties have compelled observation of such matters are practically unanimous in the assertion that more and better work is being done now than ever before. In short, the elective system has not produced any evident degeneration in the student, and at the same time his power of choice seems to have received some education.

But there is another aspect of the elective system that deserves the attention of him who desiderates the old: its results in the strengthening of the college curriculum. It goes without saying that many things of the highest value can be studied in the college with an elective system which could find no place among the vested and bequeathed interests of the institution with a prescribed course. And inside the individual college or university, as well as between colleges and universities, a competition between courses and departments must take place. Such competition for numbers has been often decried, and justly so; but there is another side. Formerly a course, however dead and dry, had to be taken, together with its instructor, however aptly the latter might match the course. There was no competition, but isolation (to use evolutionary terminology), and so no selection or survival of the fitter. Now, however, selection takes place and there ensues, as it were, a certain mortality of the unfit, of both men and courses, together with adaptability and modification to a changed environment. But this means viability and progress. The course is no longer the same yesterday, to-day, and forever, nor is the instructor; both must adapt to changing conditions to survive, or they are eliminated in the competitions of disciplines and departments. Teachers and courses that were imposed upon the curriculum even a dozen years ago would not be tolerated to-day. Better and better instruction must needs be provided; closer scrutiny is imperative. The "snap-course" is not, after all, a thing which a student ought to be so righteously blamed for finding, but one which the faculty should be censured for tolerating. If the elective system can secure in any degree the selection of the fit academic personnel and the elimination of the unfit, it has already provided a good excuse for existence; and its service will be the greater if the system enforces the need of the educated educator (for whom a plea has recently appeared in your columns) as against the prevalent fetich of what is too often the narrow, or indiscriminate and trivial "researcher."

The several ramifications of this topic might be rather indefinitely developed. It is not meant to say that student judgment, unguided and uncorrected, is to be implicitly relied upon—even though those who most decry it are not seldom fain to make the advancement of younger colleagues depend upon it in default of a better (or handier) criterion. But it is fair to say that, taken as a whole, the present tendency of things seems to be justifying itself quite as well as the old, though perhaps in a different way. In any case, there is the usual chance for the apologist in behalf of things as they are.

Yale University.

THE LEIPZIG HISTORICAL INSTITUTION

To the Editor of The Nation:

Sir: The historical seminaries of the University of Leipzig have for many years been regarded as the best in Germany. This has been an incentive to improve them still further; and during the course of the year 1908 an Historical Institution is to be formed which will raise them beyond all emulation. This Institution is to contain four seminaries; that is, one for ancient history, one for mediæval history and secondary science, one for modern history, and one for culture and universal history. To these seminaries will be added, on completion, another for historical geography and history of Saxony.

Of the above seminaries the one for culture and universal history is to be founded at a cost of $65,000. It is to have a building to itself, the floor space of which covers upwards of 700 square yards, and contains seating accommodation for 150 persons. This seminary will treat, in the first place, German culture history; but four-fifths will be set apart for the culture and history of other nations. It goes without saying that in this seminary the closest attention will be paid to the culture and history of the United States of America.

The library for this branch will be furnished as no other in any seminary on the continent. The American student will rejoice to find here the great publications of his country, as, for example, large collections of public documents. Hand in hand with the cultivation of scientific work in connection with American history will go the delivery of lectures (which have already been given during some years past) suitable for a general audience; and in order to introduce the greater public to the intimate side of American history, semi-official lectures will be added to the ordinary. In these I shall speak of my personal experiences in America. By means of stereopticon illustrations I shall try to explain those matters important to the European understanding, such as the settlements, life in the cities and towns of the East, Middle States, and West, the physiological evolution of European nationalities, etc. These lectures will also be illustrated by about 100 picture-albums of the most important cities and features of the country. Added to this I shall give to my students different American, especially German-American, journals, which will be divided among them in order to give them an opportunity to increase their intuitive powers by personal information through the press.

In my opinion these institutions, so far as I can tell, are the best to acquaint the young German with the inner life of America of the present day; because one must commence by establishing independent opinion, although the explaining word of the teacher will lead at once to a deeper insight into the life of foreign peoples. I think that for the earnest study of American culture and universal history the new Seminary of Leipzig will be better provided than any other on the European continent.

To this end I spoke at the Congress of German Philologists and Teachers, held last autumn at Basle, and laid before it a small portion of the instruction-material of Leipzig. In reporting this meeting Mr. Neil C. Brooks gave considerable attention to our project in a letter in your issue of October 17.

Karl Lamprecht.

Leipzig, December 1.

GERMAN CULTURE IN AMERICA.

To the Editor of The Nation:

Sir: The *Nation* of November 14 contained a review of Prof. Karl Knortz's book "Deutsch in Amerika." Knortz's book addresses—as the reviewer points out—Germans, but also, as soon becomes evident, German-Americans, whom the author wishes to stir up to greater activity in fostering and preserving their native language and culture. He therefore justly emphasizes the negative side of the picture. A more encouraging view may be deduced from contemplation of the aims of a small but growing proportion of German-Americans.

These German-Americans, rather than insist upon the differences between the German and the American points of view, would seek to contribute to American culture—as yet so plastic—certain elements of German culture which they by training and traditions are especially apt to appreciate. For this reason—and not in order to create and preserve a State within a State—they foster their native traditions within their homes. Because of this attitude also, they do not look to the immigrant as the sole hope of the preservation of the German inheritance, but to the children of Germans, and also to those of Americans. These children—who are all to grow up as Americans—are, it is hoped, to grow up with a prejudice in favor of things German, with a just understanding of Germany's contribution to the world's wealth of thought and art. German culture of the eighteenth century—Goethe, Schiller, Kant—has, through the efforts of men like Carlyle, Matthew Arnold, Bayard Taylor, and the Concord School of Philosophers, been to some degree interpreted. What is still entirely wanting is anything approaching a just appreciation of important phases of the literary culture of Germany in the nineteenth century. No nation has in the nineteenth century done more original work than has Germany in the drama (Kleist, Hebbel, Grillparzer, Wagner) or in the short-story (Kleist, Hoffmann, Storm, Keller, Meyer). To interpret the spirit of so characteristic a literature the German-American is peculiarly well fitted.

The gloomy picture which Knortz paints of the decay of German in the Litteratur and Turnvereine and in the German church communities, is, in part at least, offset by the growing consciousness of power which, during the last decade, has spread from the Fatherland to the Germans on this side of the ocean. Great centres of German population, like New York and Chicago, have given proof of this enthusiasm by inviting lecturers from Germany, by cultivating the national drama, and by public recognition of prominent German-Americans like Carl Schurz. That some excellent elements of German intellectuality flourish in America is furthermore proved by the existence of a German-American literature of no mean calibre. This literature is vigorous to-day, as the work of men like Martin Drescher and George Sylvester Viereck amply proves. Thus even the most severe critic must grant that not all German-Americans have become submerged in the slough of materialism.

American culture of the future, we all hope, will be many-sided beyond all others. It is the aim of these German-Americans to enrich it by the introduction of those phases of German civilization which have so far been overlooked by English criticism.

Camillo von Klenze.

Brown University, Providence, R. I., December 9.

A SUGGESTION FOR RESERVE BANKS.

To the Editor of The Nation:

Sir: Apropos of the suggestion of a central bank, in the hope that it might safeguard us from a recurrence of the embarrassments through which we are now passing, it might be worth pointing out that the existing system may be remodelled so as to accomplish the same purpose. The central bank in Europe, like the Bank of England or the Bank of France, is the custodian of the reserve of cash for the other bankers. This function is performed with us by what are known as reserve banks placed in the larger cities. Our banking practice differs so widely from the European, that while the Bank of England or the Bank of France carries a reserve seldom less than 35 per cent., and sometimes exceeding 45 per cent., our reserve banks rarely carry a reserve greater than the 25 per cent. exacted by the statute. Thus our reserve banks enjoy the privilege of the Bank of England or the Bank of France in this matter, but do not carry the burden. If it had been a condition of designation as a reserve bank that the given bank should carry a reserve, not of 25 per cent., but of, say, 40 per cent., the banks in New York, Chicago, Pittsburgh, Cleveland, Cincinnati, New Orleans, and the other reserve cities would have been far better prepared to meet the withdrawals that their correspondents have so promptly made upon them. There should be no hardship in this, for no bank need apply to be designated as a reserve bank. And if the reserve bank were required to maintain the larger reserve, we might see less of the competition among the banks in the large cities for gaining deposits at unduly high rates of interest.

W. F. J.

Cincinnati, December 9.

Notes.

The twelfth and concluding volume of Temple Scott's edition of Swift's Works will appear shortly in the Bohn Library. This is to be followed by an edition of Swift's correspondence under the editorship of C. Litton Falkiner. The edition is to be made as complete as possible, and Mr. Falkiner asks those who possess letters to or from Swift to communicate with him at Mount Mapas, Killiney, County Dublin.

Tennyson's works in nine volumes, with his own notes supplemented by those of his son, are to be added immediately to the Eversley Series of the Macmillan Co.

Records of the Past hereafter will be published as a bi-monthly, the issues being larger than the present monthly numbers.

The Bobbs-Merrill Co. publish in holiday

form a characteristic poem of James Whitcomb Riley's called "The Boys of the Old Glee Club." The illustrations are by Will Vawter.

The Oxford University Press has added to its tasteful volumes of the poets an edition of William Collins. A Memoir is contributed by the editor, Christopher Stone, and five letters of Collins's are added in an appendix.

To the Clarendon Press reprints has been added a volume of the "Minor Poems of Michael Drayton," chosen and edited by Cyril Brett. The very bulk of Drayton's work is alarming to the general reader and such a selection as this is altogether desirable. In his choice Mr. Brett seems to us for the most part judicious, but it may, perhaps, be regretted that he did not omit part of "The Muses Elizium" in order to make room for passages from the more interesting books of the "Polyolbion." We quite agree with his characterization of that much-abused poem, when he says:

Drayton's own voluminousness has defeated his purpose, and sunk his poem by its own bulk. Though it is difficult to go so far as Mr. Bullen, and say that the only thing better than a stroll in the "Polyolbion" is one in a Sussex lane, it is still harder to agree with Canon Beeching, that "there are few beauties on the road;" the beauties are many, though of a quietly rural type, and the road, if long and winding, is of good surface, while its cranks constitute much of its charm. It is doubtless, from the outside, an appalling poem in these days of epitomes and monographs, but it certainly deserves to be rescued from oblivion and read.

Even a good half of the Sonnets might be given up for a taste of that rhymed topography. Mr. Brett, by the way, points to the fact that Professor Courthope in his "History of English Poetry," wishing to refer Drayton's great sonnet to his patroness, the Countess of Bedford, and so to make the poet out a Pope in petty spite, twice quotes "rise" for "kiss" in the line:

Since there's no help, come let us kiss and part.

To the charming series of novels illustrated by Hugh Thomson the Macmillan Company has added "Silas Marner." Some of the pictures are line drawings; others are in color, but the colors are flat and have not the blotchy look so common to illustrations of the kind. As always with his work, these pictures of Mr. Thomson's are a real interpretation of the text and add measurably to the pleasure of reading.

In the "Stories from the Arabian Nights," with drawings by Edmund Dulac (imported by Scribner's), Lawrence Housman has taken a half-dozen of the best tales, and from the various authoritative translations has made a version in which the repetitions and indecencies are suppressed and the points of the narrative thrown into relief. He has, in a word, tried to get a result similar to that attained by Galland, in the old French translation, which so long stood as the basis of our English "Arabian Nights," until displaced by an irruption of pedantic Orientalists. It is a simple fact that our taste is far removed from that of the East, and that only by manipulation can these Eastern tales be made palatable to us. Mr. Dulac's illustrations—fifty of them in color, bound together at the end of the volume—are evidently in the school of Mr. Rackham. They are fluent, and on occasion beautiful; some will feel, perhaps, that he has indulged too freely in humor, and has over-emphasized the grotesque element of the stories. The press work is notably good, and this and "The Ingoldsby Legends," illustrated by Mr. Rackham, afford about the handsomest gift books of the season.

There is just a sufficient touch of the paradoxical in Ellen Burns Sherman's "Words to the Wise and Others" (Holt & Co.) to render the essays piquant reading. Nor is satire wanting, as may be seen in her cruel onslaught upon critics and reviewers in the essay called "When Steel Strikes Punk." Perhaps the most interesting chapter of the book is that containing a number of letters—the genuine correspondence of some unnamed genius—which are given to disprove the common saying: "Letter-writing has become a lost art." We can recommend the book as cheerful and dashing and fairly amusing.

Not long ago Margaret E. Noble ("Sister Nivedita") gave us in "The Web of Indian Life" one of the subtlest interpretations of that land of mystery to be found in the English language. Now, in her "Cradle Tales of Hinduism" (Longmans, Green & Co.), she has gathered a number of stories from the Puranas and the two great epics of India, and turned them into delightful English. Those who are familiar with the "Savitri"—to take the most beautiful of all Hindu stories—in the vulgarized version of Sir Edwin Arnold, will be surprised at its charm in Sister Nivedita's simple prose rendering. She calls her volume "Cradle Tales," but it is not a book for children primarily; it will interest all lovers of the magic and the human.

In "The Congo and Coasts of Africa" (Charles Scribner's Sons), Richard Harding Davis has made no noticeable contribution to our knowledge of a question on which issue has been joined so sharply. Partisanship in the discussion of the problem of the Congo we are accustomed to expect, but the present volume undertakes to adjudicate disputed matters with a cocksure lightheartedness that would be irritating if it were not so amusing. Even as journalism the book is slovenly. King Leopold, we are told "humbly sought their [the Powers'] permission to levy a few taxes. To clear roads, to keep boats upon the great rivers, to mark it with buoys, to maintain wood stations for the steamers, to improve the 'moral and material welfare of the natives,' would cost money, and to allow Leopold to bring about these improvements, which would be for the good of all, he was permitted to levy the few taxes. That was twenty years ago; *to-day I saw none of these improvements* and the taxes have increased." Whereupon Mr. Davis proceeds to describe his journey up rivers, marked with buoys, on steamers fed from wood stations which he minutely describes. Perhaps these improvements were there when Stanley first came to the Congo. On another very vital point Mr. Davis tells us:

I am not going to enter the question of the atrocities. . . . I did not see them. Neither, last year, did a great many people see the massacre of blacks in Atlanta. But they have reason to believe it occurred.

But to see things was just why Mr. Davis went to Africa. Second and third-hand testimony we have had in plenty.

"Scenes from Every Land" is a collection of two hundred and fifty of the illustrations which have appeared in the *National Geographic Magazine*. They picture in an interesting and often striking way the people, natural phenomena, and animal life in all parts of the world. The editor, G. H. Grosvenor, has added a map showing the principal transportation lines, both by land and sea, and a bibliography of gazetteers, atlases, and books descriptive of foreign countries and natural history. The book will give much pleasure, as well as instruction, to many stay-at-homes.

Reports from the Philippines are hard to reconcile, for no two observers seem to see any single condition at the same angle. The latest version of affairs there is Hamilton M. Wright's "Handbook of the Philippines" (Chicago: A. C. McClurg & Company), from which we are to infer that the climate is ideal, the natives paragons, the friars saints, and the islands an overflowing reservoir of material prosperity waiting to be tapped. For the intelligent reader who can apply corrections, many valuable facts are conveniently set forth; but the white man who does not know the tropics and the Malay should be cautious in accepting all the statements at their face value. The most immediately useful chapter is that on commerce, which might well be reprinted for circulation among our manufacturers. The recognized fly in the ointment is the oppressive tariff. Notwithstanding its bias, the book, with its three maps, a hundred and fifty illustrations, and a convenient bibliography, represents work on the spot and may be used for reference within the limitations suggested.

The material for the vivacious, good-natured sketches of unfamiliar places and people which make up "A Woman's Journey in the Philippines" (Boston: L. C. Page & Company) Mrs. Florence K. Russel acquired on the cable-laying cruise of a military vessel in the winter of 1900-1. The book, profusely illustrated from photographs, does much credit to the feminine observation of the cheery voyager and to her vocabulary; and it should render excellent service as a basis for comparison when our benevolent assimilation shall have changed the tropical environment and have transformed the ethnic peculiarities of the Malayan temperament.

In "From Sail to Steam" (Harper & Brothers), Capt. Mahan has ventured into a new field of letters, and has given us a most agreeably rambling account of his own varied experiences since entering the service which he has so greatly adorned. Sailor yarns abound, wedged in between historical illustrations, strategical maxims, and personal recollections. The period he writes of is the most important in the whole art of naval warfare, virtually a revolution. "From Sail to Steam" is but half of the whole transition. The seeker after wisdom will find his reward in tracing the progress of this revolution, even though the steps be revealed casually and incidentally. It has been difficult for the author to avoid the didactic and to lead the simple life in style, but whenever he loses himself in story or reminiscence, we are forced to wish that he had essayed the lighter vein earlier in his career. Particularly interesting is his description of

how "the influence of sea power" first attracted his attention. Some of his political views seem to need revision, such as, for example, his approval of our occupation of the Philippines. It is possible that complete enjoyment of the book necessitates a certain familiarity with naval matters and customs, but this is a fault, if it be a fault, common to all writings on special departments of human activity. We must go abroad to see lariats and lock-strings; but the latter only add spice to a book in which many a son will revel at Christmas time whenever the father can be coaxed to surrender it himself.

"A Sea Dog of Devon," a life of Sir John Hawkins, by R. A. J. Walling, with Introduction by Lord Brassey and John Leyland (The John Lane Co.), is an attempt to make a popular hero out of Hawkins. The writer dresses up his text and ekes out his material by drawing freely on his imagination. He imitates Carlyle's style. The book will interest that unknown quantity called the general reader, if he be not very exacting in his tastes. Sir Clements Markham, in his admirable introduction to Hawkins's Voyages, printed by the Hakluyt Society (somewhere about thirty years ago), has told all that is known about Sir John. The present volume is not nearly so well written as Markham's sketch. Yet the subject matter of the narrative is interesting, and those who would while away an hour or two—on a railroad train, for instance—may find this well-printed volume to their taste. One point more: What does Mr. Walling mean (at page 89), when he says, speaking of a voyage along the coast, as far as the French colony at the River May (in Florida), "Another visible result of this voyage is the name of Hawkins County on the map of Tennessee"? Since not a word is said in explanation, one may well wonder what is the connection.

Col. Thomas Wentworth Higginson has published through Houghton, Mifflin & Co. "The Life and Times of Stephen Higginson, Member of the Continental Congress (1783) and Author of the 'Laco' Letters Relating to John Hancock (1789)." Among the descendants of the twenty thousand Puritan Englishmen who, according to J. G. Palfrey, came over between 1620 and 1640, a stock constituting the New England of history, scarcely a family can be named which in every generation has been so distinguished, and which at the present moment is so conspicuously in the foreground, as the Higginsons. The line can be traced back through ten generations to the widow Joane Higginson of Warwickshire, notably a benefactor in her time, whose grandson was the Rev. Francis Higginson, first minister of Salem, one of the most amiable and interesting of early New England worthies. His affecting farewell to old England, from the deck of his ship off Land's End, will always be remembered, and the cheerful optimism of his diary makes it one of the pleasantest of our early documents. In his son John, long-lived and to the last useful, the name is carried on worthily into the eighteenth century, to be continued there by worthy successors. Nor did the fine force of the family abate in the nineteenth century, or in the twentieth so far. Rear-Admiral Frank J. Higginson, Major Henry Lee Higginson, and Col. Thomas Wentworth Higginson continue to illustrate the name in widely different spheres of activity, by service of the best. In a chain so honorable each link is worth looking at, but the subject of this memoir, even if he were without good forebears and good descendants, had merits in himself entitling him to special attention. Col. Higginson well asserts his grandfather's right to a biography. As an enterprising young sea captain he was interrogated by Edmund Burke, for the House of Commons, as to pre-revolutionary discontents in America; in our "critical period" he was a member of Congress; in the Shays rebellion he was second in command in the strenuous if not sanguinary winter campaign in behalf of law and order; he was "the first to argue from that peril the need of a stronger government—the first to suggest that the voices of nine out of the thirteen States could make the confederacy into a nation—the first to organize and equip the American navy under Jefferson's administration." The man of whom these things can be said should have a good place on the American honor list. This book makes it plain that Stephen Higginson served his generation effectively also in less conspicuous ways. As author of the "Laco" letters, he laid bare, keenly and courageously, shortcoming in high places; though a zealous Federalist, he could be genial amidst the acrimonious controversy. His State, his city, had always his watchful care. Active as he was in the rather obscure period between the Revolution and the vast agitations which, about the third decade of the nineteenth century, began to rack the Union, the details of his life are illuminating as regards a time which we ought to know better. Col. Higginson, while venerating his ancestor, writes always with restraint and good taste, and, of course, out of full knowledge of his subject's environment.

If there are any American buildings which deserve to be the subject of two-volume histories, the President's House at Washington is one of them. It has been the centre of such official society as this country has developed, and next to the Capitol the centre of its political life. In its one hundred-odd years of life it has seen two-thirds as many changes of occupancy, when one head of the State succeeded another, as Windsor Castle has in eight hundred-odd. Nearly every distinguished foreign visitor to this country has been entertained there, and a goodly share of them have put down somewhere a record of Presidential hospitality. Memoirs of famous Americans are full of allusions to the old house, while Washington abounds with its traditions. All this has furnished abundant material for the two volumes of Esther Singleton's "Story of the White House" (The McClure Co.). Odd bits of information may be found throughout her work. Thus, she finds the name "White House" used first in January, 1834, during Jackson's term, by a journalist who puts it in the same quotation marks which he uses for "Kitchen Cabinet." Roosevelt gave the colloquial name official sanction. Van Buren was the first President who had policemen to regulate the crowd at his receptions, though Dickens and others had commented on the orderly behavior of the undisciplined crowds of an earlier day.

To those looking for a religious book as a gift, we can recommend a beautifully printed edition of "The Imitation of Christ," published by E. P. Dutton & Co. The colored initials have the effect of hand painting, and the whole book is comely without being gaudy.

An example of the industry and thoroughness of German Catholic scholars appears in the first volume of the "Kirchliches Handlexicon," edited by Prof. Michael Buchberger of the Lyceum at Regensburg (München: Allegemeine Verlags-Gesellschaft). The work is designed for ready reference, the first volume consisting of 12,000 concise articles on all manner of subjects related to theology and ecclesiology. Social science, Christian art, Church music, sacred geography, ecclesiastical statistics, biography, and hagiography are among the general themes which are carefully treated. Special attention is paid to bibliographical references to recent literature of all schools. Scholars to the number of 170 appear in the list of contributors, and the authorship of each article is indicated by initials. In editorship Professor Buchberger was assisted by Profs. Karl Hilgenreiner, Joseph Schlecht, and Johannes B. Nisius, S.J. As a practical reference work this lexicon does not compare unfavorably with the "Catholic Encyclopædia" now appearing in America.

Dr. Mark Lidzbarski of the University of Kiel has begun the publication of a collection of old Semitic texts, in Hebrew transcription, where necessary, which is to furnish the non-specialist with practically all the material for study which a *corpus inscriptionum semiticarum* would give. The first *Heft*, 64 pages, is entitled "Altsemitische Texte: herausgegeben und erklärt, I; Kanaanäische Inschriften (Moabitisch, Althebräisch, Phönizisch, Punisch)." Giessen: A. Töpelmann, 2 marks. The prospectus shows that further instalments are to cover practically all of the Semitic dialects. This first pamphlet includes the Mesha stone, the Siloah inscription, Eshmunazar, and less important inscriptions as also some sacrificial tablets.

The second edition of the "Hebräische Archæologie," by Dr. I. Benzinger, which, since its original publication in 1894, has been a great authority in its field, is to all intents and purposes a new work. While the former edition was largely under the spell of Wellhausen, the present work, on the basis of the best of modern "Panbabylonism," systematically arranges the wealth of data, old and new, to explain the antiquities of the Hebrews in their relation to the whole civilization of Western Asia, particularly of Babylonia. Benzinger is particularly qualified for this work, having for years been engaged in archæological investigations in Bible lands with headquarters in Jerusalem. A feature of this work is the 253 illustrations and the plan of Jerusalem. The book is not too technical to interest others than the specialist. It is part of the well-known series, Grundriss der theologischen Wissenschaften, published by Mohr of Tübingen; price 10 marks.

A collection of essays on educational subjects, from the pens of leading teachers in Germany, has been published in two volumes under the title "Deutsche Schulerziehung," by Prof. Wilhelm Rein, of the University of

Jena. (Munich: J. F. Lehmann). The contributors, about thirty in number, although dealing primarily with German school problems, practically cover the whole educational field as far as the discussion of principles is concerned. The educational methods of foreign nations are separately considered, the account of the American system being furnished by Director Griebsch.

It is reported in the German press that Herr Bebel, Socialist leader in the Reichstag, is writing his memoirs, to be published posthumously.

K.-A. Forslund's latest book, a small collection of "Skogssagor och Jurskisser," sketches of animals and of outdoor life, has an undercurrent of that scientific, not to say naturalistic, view of life that has received perhaps its most famous modern expression in Turgenieff's "Nature." The last sketch is a dream of how Sweden becomes a republic, (Stockholm: Wahlström & Widstrand.)

"Symra, En Aarbog for Norske paa begge Sider af Havet" (A Yearbook for Norwegians on Both Sides of the Ocean), published at Decorah, Ia., deserves to be more widely known. It is edited by Kristian Prestgard and Joh. B. Wist, the latter of whom is Norwegian consul for Iowa. The present volume, just issued, is No. III., the first having been issued in 1905. The contents, contributed by writers in Norway and this country, are devoted largely to Norwegian literature, politics, and history. Of special interest are the article on Wergeland and Welhaven by Johan Herzberg and another by J. Lövland, who was recently appointed Prime Minister of Norway upon the retirement of Chr. Michelson. Mr. Lövland gives a sketch of "Steen and Boström" (with the sub-title "Reminiscences from the Period of Union"). Coming as it does from one who for many years was intimately and actively associated with Norwegian politics and who had a large share in the events which led up to the separation of Norway and Sweden, this characterization of two of the principal figures in the later years of the dual monarchy is of unusual value. This volume contains also an article by the Norwegian historian, Halvdan Koht. Something over a year ago there was organized in Norway a Nordmandsforbund (Norwegian Union), the object of which is to bring Norsemen in all parts of the world into a closer intellectual union. In connection with this it may be noted that to-day fully one-third of the race are residents of the United States. Of this Norwegian union "Symra" will in a measure be the unofficial American organ.

In fulfilment of the plans for more aggressive work, announced by the director of the State Library at the recent meeting of the New York Library Association, two new officers have been created by the State Education Department, "library organizers." Their function will be "to work in the field throughout the State, encouraging the establishment of new libraries, invigorating and helping to reorganize dormant libraries, advertising and placing travelling libraries, and generally stimulating library development and the reading habit, especially among the villages, hamlets, and rural communities of the State." The beginning of this work is partly due to recommendations made at the meeting of the State Library Association a year ago, but more directly to the special investigation carried on last year by the commissioner of education, convincing him that in spite of liberal appropriations made by the State, library conditions, particularly in the more sparsely settled sections, are by no means "as satisfactory as may be desired."

The special committee of the Indiana Library Association appointed last year to investigate salaries in that State has presented an exhaustive report, covering not only this particular question, but library incomes, tax support, ratio of expenditures for different purposes, and some comparative statistics as to salaries paid in other callings. The report shows that the average monthly salary of librarians having some college or normal school education is $54; for those without such education, $44; for those who have been trained in library schools, $56. In Indiana the average salaries of librarians are less than those of bakers, book-binders, stone-cutters, and type-setters. As modifying the significance of these figures, however, it is to be borne in mind that the great majority of librarians are women and girls, while the majority of those engaged in these other occupations are men; and also that all the members of a library's staff are listed as librarians, though the duties of a majority of them are largely mechanical and call for no more training than does an ordinary trade. Thus the average is but a slight indication of what those who are librarians in the true sense of that term are receiving. Whatever the effect of low salaries, the development of libraries in the State has not seriously suffered. The report of Chalmers Hadley, secretary of the Indiana Library Commission, shows the following advances since 1899, when the Library Commission was established. At that date the number of public libraries in the State was 57; to-day the number is 115, which with the 175 institutional libraries makes a total of 290 public or semi-public libraries. In 1899 there were but 7 public libraries in specially erected buildings; to-day there are 65 public library buildings, with half a dozen more in course of erection. In 1899 there was but one Indiana librarian who had attended an accredited library school; at present there are 32 graduates of such schools, and 120 others who have had training in summer schools.

Emile Berliner of Washington, one of the perfecters of the telephone and the inventor of the gramophone, has given $12,500 as endowment of a research fellowship for women, the subjects to be limited to physics, chemistry, and biology. The foundation, which is in honor of the donor's mother, will be known as the Sarah Berliner Research Fellowship for Women. The award will be made by a committee of women, of which Mrs. Christine Ladd Franklin of Baltimore is to be the chairman. Most fellowships now accessible to women are given to recent graduates of colleges, to enable them to proceed towards the degree of doctor of philosophy. The object of this endowment is to give to women who have shown, in work already accomplished, real promise as investigators an opportunity to pursue special scientific researches.

Edward Hicks Magill, formerly president of Swarthmore College, died in this city December 10. He was born in Solebury, Bucks County, Pa., in 1825, and his first experience as a teacher came at the age of sixteen, when in his father's loft he instructed the boys and girls at three cents a day each in the old-fashioned lessons of the period. After graduation from Brown in 1852 he taught in the Providence High School and the Boston Latin School. In 1867 he went abroad and spent two years in travel, returning to join the faculty of Swarthmore College, of which he became president in 1870. He resigned that position in 1889, and went to France; from 1890 to 1902 he was professor of French at Swarthmore. He was author of various text-books, including "French Grammar," "Intermediate French Reader," "French Prose and Poetry," "Reading French Grammar," and "Modern French Series" in four volumes. This year he published an interesting autobiography, "Sixty-five Years in the Life of a Teacher, 1841-1906." reviewed in the *Nation* of June 6, p. 524.

Leighton Coleman, Episcopal bishop of Delaware, was found dead in his bed at Wilmington last Saturday morning. He was born at Philadelphia in 1837 and was graduated from the General Theological Seminary of New York in 1861. After serving three or four different churches, and residing some years in England, he was made bishop in 1888. He was author of a "History of Lehigh Valley," 1872; "The Church in America," 1895; and a "History of the American Church," 1901.

The Rt. Rev. George Howard Wilkinson, bishop of St. Andrew's, Dunkeld and Dunblane, and Primus of the Scottish Episcopal Church, died in Edinburgh December 11. He was born in 1833, and was educated at Durham School, and at Oriel College, Oxford, from which he received the bachelor's degree in 1855. Coming early under the influence of John Henry Newman, he took holy orders, and, in 1857, was appointed curate of Kensington. After several promotions in the church, he became bishop of Truro in 1883; ten years later he went to the See of St. Andrew's, Dunkeld and Dunblane in Scotland. He was a prolific writer of devotional books, many of which have gone through numerous editions. Among them are: "Holy Week and Easter," "How to Keep Lent," "Instructions in the Devotional Life," "Instructions in the Way of Salvation," "Lent Lectures," and "Some Laws in God's Spiritual Kingdom."

Alfred Stead, associated with his father in editing the London *Review of Reviews*, died December 15. He was born in 1877 and educated at University College, London. Among his books are "South Africa" (with W. D. Mackenzie, 1899); "China and Her Mysteries," 1901; "Japan, Our New Ally," 1902; "Japan by the Japanese," 1904; "Great Japan," 1905; "Japanese Patriotism," 1906; "Servia by the Servians," 1906; "Bulgaria by the Bulgarians," 1906; and "Macedonia and the Way Out," 1906.

Heinrich Dernburg, professor of Roman and Prussian law at the University of Berlin, has just died at the age of seventy-eight. Among his works are "Das Vormundschaftsrecht der preussischen Monarchie," "Lehrbuch des preussischen Pri-

vatrechts," "Pandekten," "Das bürgerliche Recht des deutschen Reichs und Preussens."

BOOKS ON ITALY.

Browning's Italy: A Study of Italian Life and Art in Browning. By Helen Archibald Clarke. Illustrated. New York: Baker & Taylor Co. $2 net.

Sunny Days in Italy. By Elise Lathrop. New York: James Pott & Co.

The Lakes of Northern Italy. By Richard Bagot. Illustrated. New York: The Macmillan Co. $1.75.

Florence and the Cities of Northern Tuscany, With Genoa. By Edward Hutton. Illustrated. New York: The Macmillan Co. $2 net.

The Naples Riviera. By Herbert M. Vaughan. Illustrated. New York: F. A. Stokes Co.

The Riviera. Painted and Described by William Scott. New York: The Macmillan Co. $6.

The rational admirer of Browning cannot presume to fathom the intellectual needs of the Browningite, for whom, apparently, Miss Clarke has compiled her "Browning's Italy." The compiler presents her selections and commentary in five chapters, covering, roughly, the early Renaissance, political life, the Italian scholar, the artist and his art, and social life. We have not detected any first-hand impressions; nor do we recall any fresh or striking criticism. With Mr. Sedgwick's somewhat scrappy little manual in one hand, and a volume of Symonds or Vasari (translated) in the other, Miss Clarke feels herself qualified to go forth, to expound Robert Browning and Italy to an ignorant world. So far as appears, she has no first-hand acquaintance with Italian; certainly she does not cite even the better-known historians and critics of the Peninsula. Her selections include, of course, many of the favorites which every reader of Browning would approve. And yet we must, in justice, confess that Miss Clarke's compilation is admirably adapted to minds which have not yet thought for themselves: and as there are many such minds, her book ought to be popular. We have noted several misprints and solecisms. Such forms as Porto Pisan*a*, Porto Romano (for the Florence gate), primevera, and Ponta Vecchio can hardly be due to typographical slips. The volume is well-made as to paper and type, and has a score of excellent half-tones. It lacks an index, which is necessary, especially to the many extracts from Browning.

The newly arrived traveller in Italy often wonders rather resentfully why he has never been told about countless details that soon become essential parts of his mental picture of the country. This will hardly be his experience, if he has ventured to look between the lurid covers of Miss Lathrop's "Sunny Days in Italy"; for, although the author treats almost exclusively of well-worn and over-written ways, she has given her account a spice of novelty by mentioning the very characteristics that in similar books are usually passed over in silence. She tells us, for example, that postage stamps may be bought, even by women, in tobacco shops; she explains the system of fares in Roman trams, mentions the important distinctions between the varieties of trains, and describes the railway luncheon-baskets, as well as the incomparable ceremony that precedes the leisurely departure of a train from a railway station. Her friendly and eager observation of the life about her makes her account of Cernobbio, Alassio, Genoa, and especially of Pisa, interesting and valuable. Unfortunately, at least two-thirds of the book is a perfunctory performance, without *raison d'être*. The chapters on Florence, Siena, and Verona are so inadequate that they might better have died before birth; and surely "the wronged great soul of an Ancient Master" stands near an author, who devotes nearly two pages to the Church of St. Anthony at Padua, and dismisses Giotto's "very interesting" (*sic*) frescoes in the Arena with four inappreciative lines. The worst defect of the book, however, is found in the errors in style with which its pages bristle. We meet such atrocities as this:

> Close to the university are the two squares, the Piazza dei Frutti (of fruits) and the Piazza dell'Erbe (herbs), separated by the building called the *Salone* from a great arched hallway of wood, dating from the fifteenth century, and which building contains more than three hundred allegorical frescoes (p. 275).

Nor is the book free from errors in statement. For example, the terrace of the Pincio commands a view, not of the Piazza di Spagna (p. 169), but of the Piazza del Popolo, a very different place. It was the Empress Livia, not the historian Livy, who had a house on the Palatine (p. 176). The cabinet in the Sala dell'Immacolata was presented to Pius IX., not to Leo XIII. (p. 183). There are also indications of careless proof-reading, the most disastrous result of which is that the titles of the illustrations facing pp. 264 and 274 have been interchanged. Yet, in spite of these defects, the book may be recommended for its practical, sympathetic, and in many respects novel account of the Italian customs of to-day.

Richard Bagot has turned from writing novels long enough to write an interesting semi-guide (if the word be permitted) to "The Lakes of Northern Italy." We say "semi-guide," because it does not give the material details which the tourist needs to know, but describes fully, and often picturesquely, all the main-travelled spots and many of the out-of-the-way ones. Mr. Bagot does for this region what the late Augustus Hare did for Florence, Rome, and Venice; and he spices his descriptions with views of his own on whatever subject comes up—smuggling, snaring little birds, S. Carlo Borromeo's right to the halo of a saint, or the magnificent but neglected scenery of Lake Garda. He does not forget to recall the historical event or the legend associated with each place. Sometimes, as in epitomizing the story of Vittoria Accoramboni—the supposed original of Webster's White Devil—he would have done well to state that there is a side contrary to that which he gives. Printed on thin paper, his little volume, which has good half-tones, a sketch map, and an index, may be recommended to every traveller whom good fortune leads to North Italian lakes.

Edward Hutton, another Englishman who divides his time between fiction and Italian travel, has chosen "Florence, and the Cities of Northern Tuscany, with Genoa," for his theme this year. Word-painters, like color-painters, now go afield for their sketches. Mr. Hutton is not so compact as Mr. Bagot. He writes profusely, not to compile a practical guide-book, but to pour out his impressions, experiences, and reflections on the places which he visits. In brief, he is literary—to be enjoyed or not, according to the reader's taste. A *cicerone* who discourses to the length of forty pages about Genoa without mentioning Mazzini is evidently not of Baedeker's pattern. But he is enthusiastic, and he has a style, as may be seen in this introduction to Florence:

> Florence is like a lily in the midst of a garden gay with wild-flowers; a broken lily that we have tied up and watered and nursed into a semblance of life, an image of ancient beauty, as it were, the *memento mori* of that Latin spirit which contrived the Renaissance of mankind.

In criticism of the historical inaccuracy of this remark, we might say much, but space forbids. In general, we find Mr. Hutton's mediæval preferences somewhat tiresome. Ruskin pilloried modern vulgarities once for all. And Mr. Hutton indulges rather too freely in sentimentality. He seems to be an amateur in history, in art, in emotion, addressing amateurs. Nevertheless, he succeeds sometimes in speaking about art and life less affectedly than we fear he will. Literary pre-Raphaelitism in the third or fourth generation moves us not. The book has colored half-tone illustrations.

Herbert M. Vaughan, who describes "The Naples Riviera," has a similar purpose. He does not compete with Murray or with Baedeker. "We pursue our own course," he says, "and touch lightly here, and omit there; we run to dissertation in this place, we glide silently by in another." He, too, has dipped intelligently into history and literature, and, as he takes us through Naples, or Pompeii, to Salerno, Sorrento, Pæstum, Amalfi, Capri, and Ischia, he calls up many of the well-known figures, or cites the familiar passages. He is more concrete than Mr. Hutton, and, therefore, to our thinking more interesting. He conscientiously provides an index, and the publishers have added twenty-five colored pictures by Maurice Greiffenhagen.

"The Riviera," the most elaborate of these volumes, is by William Scott, a painter who makes his own illustrations. So the point of view is artistic rather than literary. Nevertheless, Mr. Scott takes an eager interest in the people and their past, as well as in landscape, and he has rausacked local histories. He describes not only the natives but the swarm of foreigners who flock to the Riviera during the winter. Starting at Hyères on the west, he follows the magic sickle of sea and shore round to Sarzana, pausing at many out-of-the-way places, making excursions up the valleys, or sitting down beside some ruin to recount its story or merely to chat. There is a certain insular point of view, a typical British condescension in some of his remarks: and as he dedicates his book to the Duchess of Argyle, we must expect several references to the sojourn of Queen Victoria and her family on the Riviera, while such a trifling event as the sailing of Garibaldi and his Thousand from Quarto is omitted. But after all, Mr. Scott is an agreeable guide, not wholly

deficient in humor; and his sketches are often very fine. It is by them that he should be judged. They form a delightful series, which really illustrates the varied beauties of the Riviera. Colored illustrations are still at the experimental stage, as may be seen by comparing these three volumes of Messrs. Hutton, Vaughan, and Scott. In the first two lobster reds, indigo blues, and solferino yellows abound; but in Mr. Scott's the coloring is more delicate, and adds genuinely to the pictorial effect.

CURRENT FICTION.

Margaret. By Rider Haggard. New York: Longmans, Green & Co.

The cover design of this book—a couple of knights with two-handed swords, in attitudes suggestive of the teeing-ground—is admirably descriptive of the contents. The story is the most conventional of plate-armor romances, with a full equipment of the usual stage properties. One by one we recognize our dear old friends—the supernaturally beautiful heroine, "fair Margaret, she was called," the strong, silent hero, the Spanish villain, the Woman Scorned (needless to say her name is Inez), the combat to the death, the auto-da-fe, the brigand-haunted inn. The latter in especial is pleasantly familiar, from the drugged wine and the boltless trap-door to the moment when "with a sweep of the sword that lay unscabbarded at his side, Peter had shorn off that arm above the elbow, just where it projected from the panelling."

"Margaret" is a good enough tale of its kind, but one would think that the saga-man of strange lands might afford to leave this field to printward-aspiring young ladies and the Rev. Mr. Crockett. Since Mr. Haggard's pot must boil, are there no legends left in Zululand? Why not Umslopagaas Redivivus as well as Sherlock Holmes?

The Emily Emmins Papers. By Carolyn Wells. New York: G. P. Putnam's Sons.

"Emily Emmins, spinster," has written down a vivacious account of her trip to London and brief sojourn in that city and its vicinity. In setting out from New Jersey, her determination was to eschew sight-seeing and the whole cult of Baedeker. A traveller more suspicious of the traveller's immemorial privilege of sentiment is not often encountered. Although one day was actually given to a Stratford visit, it was only upon a tacit agreement with her companion that neither of them should hazard a single quotation from Shakespeare; and the climax of the day's adventures was reached when these sophisticated pilgrims, who had followed what they supposed to be the footpath route across the fields to the Arden cottage, discovered that they had gone in precisely the wrong direction, and that the hour was now close on train time! It may be said at once that this over-conscious avoidance of sentiment, of "first impressions," of everything, in short, which might possibly be termed conventional, becomes at last a little wearing. A prudent distrust of the commonplace is well enough; but it is a pity if all the conventional ways of humanity must be rendered anathema, merely because many tedious people have pursued them.

Be that as it may; for shrewd, humorous observation upon English society and manners—and it was to this field that "Emily Emmins" gave her chief attention—nothing more engaging than these same "papers" has appeared for a long time. Here is to be found, for instance, an inimitable little treatise upon that typical English hostess, who greets one with "a sudden, inordinate gush of welcome"—"You dear thing! how sweet of you to come!"—and relapses the next instant into a fit of icy abstraction, quite oblivious of her guest's existence. Accounts of week-end house-parties out of town, of tea-drinkings, of shopping experiences in Piccadilly, and of that alluring social game known as "going on," are all admirably done. Finally a word of praise should be given to the clever outline sketches by Josephine A. Meyer, which add one more touch of liveliness to an uncommonly lively and readable text.

Gunhild. By Dorothy Canfield. New York: Henry Holt & Co.

Miss Canfield's book gives one the feeling that it was inspired by a contralto voice singing "Ein Jüngling liebt ein Mädchen" under the glamour of the Midnight Sun. It is a little tragedy of misdirected love, in a vividly depicted Norwegian setting; and it is so well written as to leave one distinctly depressed. The story is summed up in a paragraph by the finest and most vital of the characters, Aunt Nancy, who suffers gallantly through the entire book from sciatica, heartache, and the selfishness of her companions:

> A rattle of drums startled them into observation of the outer world. The hour for changing the sentinel had come, and the guard was about to escort him back to the barracks. The big peasant lads, burly in their ill-fitting uniforms, looked anxiously at a trim young officer before them. He gave a word of command, and like automata, all together, they put their right hands on their hips with elbows out, turned their heads and eyes stiffly to the right, and straightened their line, measuring accurate, equal distances from each other by their upraised elbows. Miss Fox began speaking in a low voice as though she were thinking out loud. "You ask why? Look at the soldiers and see. I don't know what that command is in Norwegian, but in America it is 'Right dress!' And it is what most of us are doing all our lives—looking to some one who in turn is looking to one further on, always separated by a space small but impassable. See: all my life I have looked to Ralph Morton, he looks to his wife, and she to her pretty clothes and foolish social life. Campbell looks despairingly at Caroline—Caroline at you; oh, you might as well hear it spoken of! And, remember, if you wakened Gunhild to love and saw her give that love to another, Caroline stirred you to a desire for a man's life, roused you from your drifting apathy, and saw that new ardor bestowed on another. Caroline looks to you, I say; you to Gunhild; she to her officer, and he to his Fatherland.

Gunhild, born in Kansas, and still hungering for the sunny vastness of the prairies, is finely portrayed, but convincing as she is in her beauty and simple nobility, Aunt Nancy takes precedence of her as the real heroine of the book. We are quite content to leave Gunhild on the sunlit crag, clasped in the arms of her blue-eyed Viking; indeed, it is such a relief to feel that somebody is happy that we are not inclined to venture a backward look. But it is safe to say that no mature reader can turn from the undiluted misery of the last chapter without an ardent desire to shake the intolerable Caroline out of her self-absorption into some human consideration for the long-suffering saint whom we leave as she is about to add to her other burdens the last horrid straw of seasickness.

The World at Eighteen. By Ray Costelloe. London: T. Fisher Unwin.

At eighteen Miss Charlotte Kingconstance was brought from college in England to learn the world in a Tuscan villa. The world was represented there by an uncle, a desiccated rationalist, who took her as an interesting adolescent specimen; and by a distant cousin, a dab of a sculptor, but a finished superman who regarded her as a sentimental opportunity, and later as an eligible wife. If we should say one good word for this Mortimer Morris, we should be faithless to the traditions of good manners and morals that guide this journal. At twenty-two he recounts the twelve love affairs of his undergraduate years—including the girl he left behind him because she dressed in the fashion of Cambridge, Mass.—complains in company of the advances of collective middle-aged womanhood, openly laves in the flattery that a cleverness, by no means apparent on the printed page, procures him—in general comports himself as an impossible cad. Happily, the intervention of two potentially homicidal man servants lets him prove that he is not a coward as well. Frankly, we cannot believe that this male monster, who combines the effrontery of shameless youth with the indiscretion of doddering bad old age, could ever exist, except in the imagination of a nice bewildered girl. But since it was Miss Charlotte's bad luck to learn the world through such a creature, we cannot wonder that she found it "a terrible, yet beautiful, place, in which, each separate being struggles alone, desperately alone, without comprehension or insight or thought or care for anything but itself."

If Mortimer is framed rather flimsily on the familiar lines of smooth, complicated villains, Miss Charlotte is quite real. Her trials with the world as it hurt her are told artlessly and affectingly, if without distinction. Her trouble, aside from the false Mortimer, whom she happily escapes in the end, seems due mostly to the awful amount of tall talk that was encouraged in her mother's villa. It was disquieting to a good girl fresh from undergraduate mathematics. Just once the self-centred Mortimer gave her the key to the matter, but she was too preoccupied to accept this single favor from the enemy. He said in a moment of unusual laconism: "Do you know, I have often puzzled and wondered what people meant, and then found out that they meant nothing." Of course, the ruthless Mortimer took no harm from such disillusionings, but Miss Charlotte did, and her experience may serve as a reminder to loquacious, expatriated dilettanteism that a certain reverence is still due *virginibus puerisque.*

Arfvet. By Hugo Öberg. Stockholm: Wahlstrom & Widstrand.

One of the figures in Hugo Öberg's early novel, "Makter," otherwise a rather sordid affair, was a young man, Henrik Almer,

who was presented as of unconscious power and firmness of poise, though there was nothing to show how he had developed these qualities. One critic wanted to know something of his earlier life, and in his latest book, "Arfvet," the author tells the story. It is a love story, though not of the pretty kind. but through it all one can see how the experience draws out the solid qualities of the man—and, one must think, of the woman as well.

The Life of Goethe. By Albert Bielschowsky; authorized translation from the German, by William A. Cooper. Vol. II., 1788-1815, from the Italian Journey to the Wars of Liberation. Illustrated. Pp. xi., 454. New York: G. P. Putnam's Sons. $3.50 net.

The period marked by this volume* was one of extraordinary upheaval and reconstruction: the French Revolution, the Napoleonic wars, the downfall of French supremacy. What in Goethe's life and authorship paralleled this quarter-century of world politics? The Italian Journey was an unconscious farewell to the *ancien régime;* the spirit of the régime is reflected everywhere in Goethe's *Reise,* in his letters, in his works finished or begun in Italy. The new Weimar life was to give full expression to the classic spirit of repose and artistic finish. *Dis aliter visum!* Although Goethe's style had achieved its perfection, neither he nor any one else was destined for repose. Even on Italian soil the old Goethe spirit of tricksy freedom broke out occasionally; readers of "Faust" will not forget that the Hexenküche scene was composed in the Villa Borghese.

Chapters i. and ii. of the present volume deal with "Iphigenie" and "Tasso," usually regarded as the most polished of Goethe's poems. Certainly they are enjoyable; they are even used as texts in our German classes. Yet one may indulge in speculation upon the final valuation which the Anglo-American mind is likely to put upon them. The present reviewer, wholly free from bias, is disposed to treat the question as a problem. In structure, content, subtlety and grace of diction, "Iphigenie" and "Tasso" tower above their predecessors; they proclaim a mighty growth of the poet's spirit. But do they appeal to us as directly and strongly, do they sweep us away with the dæmonic power of a "Werther," or even of a "Goetz," not to speak of the early lyrics and ballads in which heart speaks to heart? If we are perfectly sincere with ourselves, we shall probably admit that "Iphigenie" and "Tasso" leave us cold, at least cool. Of "Tasso" in especial we may add that its limning is too delicate, its character-touches are too subtle for true dramatic action. Every teacher of German must have perceived that the real essence of "Tasso" eludes the undergraduate mind, baffles it. In comparison the most phantasmagoric part of "Faust," the Helene act, is actual, palpable, almost elemental. In "Faust," once the situation is grasped, however imperfectly, we feel that the story moves; whereas "Tasso" is always going to move, and that is quite another matter. At any rate, Bielschowsky's remarks on the growth and final shaping of the two dramas are highly instructive.

Chapter iii. presents Goethe's life and personal relations in Weimar after his return. This order is not strictly chronological, but is in the main more satisfactory; "Iphigenie" and "Tasso," in their inception, antedate the Italian journey. In Weimar Goethe was not merely a changed man, he became decidedly isolated. For several years the bond of union between him and the Weimar circle was weakened to the point of dissolution. We know this more clearly than the mid-nineteenth century knew it. For this change Goethe himself had a larger share of responsibility than Bielschowsky seems ready to admit. Here the biographer's nationality has obscured somewhat his vision. The German of 1900 finds it difficult to see Weimar in 1789 without the halo of 1830. Perhaps the foreigner, knowing less, may have a truer intuition of what lay beneath the surface. The all-determining factor in the situation was this: For nearly two years Goethe had led the broadest, the freest existence, had meditated deeply upon Roman imperialism and Papal supremacy in daily sight of their abiding monuments; his associates had been either persons who reflected Italian greatness or persons who, like himself, had come to Italy to profit by the highest culture of which the world was then capable. Whether in Rome or in Venice or in Naples or even in Sicily, everything proclaimed a wealth of tradition, a breadth of vision from which the home-returned traveller was utterly debarred. Small wonder, then, that Goethe, supereminently gifted, a devotee of all that was uplifting, should feel himself cabined, cribbed, confined in pettiness. Weimar, let us be frank, must have been to him in his moments of depression little better than a *dorf,* and he himself in danger of *verbauern.* Of course, the picture is anything but just to Weimar; we know that the town and the duchy and all Germany were on the way to a new greatness all their own. Yet the picture, despite its injustice, will let us into the secret of Goethe's mood. Overmuch has been made, especially in America, of the scandal provoked by Goethe's connection with Christiane Vulpius. Such affairs were only too common in the eighteenth century. Apart from Frau von Stein, it may be doubted whether any one in Weimar was deeply shocked and aggrieved. We shall do well to bear in mind Hermann Grimm's caustic remark, that what really upset Weimar was not Goethe's original liaison with Christiane but his subsequent impulsive marriage with her. Quite independently of the liaison, Goethe appears to have held himself more or less aloof from his former associates, even from the Duke.

The reinstatement of Goethe in his rightful position was indubitably the mission of Schiller. Chapter vii., which narrates the steps in the process, is very pleasant reading. It is the soberest account which we have of the working of Schiller's mind upon Goethe's. The biographer, refraining from the customary gush over the spectacle of the Dioscuri, makes us feel Goethe's loneliness and reserve breaking down and disappearing before Schiller's hearty devotion. In this connection Bielschowsky's remarks upon Jena are significant; they reveal the motive of Goethe's frequent visits, by showing that the university town was passing the ducal residence in intellectual activity.

Chapter ix., "Hermann und Dorothea," will be to the general reader doubtless the most attractive in the volume. It could scarcely be otherwise; one must be a veritable botcher to spoil such a theme. The reviewer need only say of Bielschowsky that he has handled the poem with the simple dignity and charm which are its due. One of his points, indeed, is novel: the contention that although the frame-work of the story was taken from the well known incident of the Salzburg emigrant girl, the impulse of the poem came from the experiences of Elizabeth Schönemann, "Lili," with the French Revolutionists. The contention seems to us plausible and suggestive, provided it be not pushed too far. Lili can scarcely have stood as the actual model for Dorothea, physically or mentally. Dorothea is described as of heroic stature and temper, calm and self-contained; whereas the Lili of the old Frankfort days —Goethe had not seen her since then—was little more than a girl, slender, vivacious, endowed with a charming abandon which haunted Goethe the rest of his life. In further criticism we would ask why Bielschowsky speaks so frequently of Hermann as a "peasant." This is to ignore the circumstance that the father, in addition to his goodly acres, is owner of the Golden Lion, with its well-stocked wine cellar, a man who expressly describes the best existence as one in which farming is coupled with trade. Of Dorothea it is enough to say that nothing in her suggests the peasant.

The "Meister" (Part I.) is handled in Chapter viii., "Elective Affinities" in Chapter xii. Our knowledge of these monumental prose works, if not greatly augmented, is at least quickened. Over certain delicate passages, notably where Philine and Mignon are involved, the critic passes with the nimbleness of a skater upon thin ice.

The concluding chapter, xiv., which deals with the political upheaval of 1808-1815, must have cost the biographer much anxious thought. Clearly the problem was one of naught extenuate nor set down aught in malice. Between the already aging poet and the new Germany of the Uprising there was a gulf which time alone could close. Young Germany was not always mindful of the fact that its illustrious poet was in character and temperament essentially of the eighteenth century; on his part the poet, not being also a prophet, could not foresee whither his country was drifting. Thanks to Bielschowsky's sober unravelling of the tangled threads, we are able to perceive that the misunderstanding was much less grave than it once seemed. It disappeared altogether with the appearance of "Dichtung und Wahrheit." Here the veritable Goethe revealed himself in all his attributes and characteristics, the most German of them all. Yet, incredible as it must sound, we are to chronicle the fact that "Dichtung und Wahrheit," the greatest of Goethe's prose writings, in truth the greatest of all his writings except the "Faust," is nowhere treated by Bielschowsky fully and by itself; it gets only passing mention in half a dozen places. Why this inexplicable oversight? Of course the substance of the autobiography has passed into Biel-

*For notice of Vol. I. see *Nation* of May 24, 1906.

schowsky's narrative of Goethe's youth. But the sheer constructive genius of "Dichtung und Wahrheit," its marvellous atmosphere, its significance as a whole for the interpretation not only of "Faust" but of all German literature and history, surely these are matters worth a chapter to themselves in what aspires to be the Goethe biography by eminence.

Of the translator, a word or two. He is gaining in precision and ease with the progress of his work, for he takes his work seriously. It is a credit to our scholarship, and we owe him thanks. Yet the conscientious reviewer may permit himself an occasional grumble. Thus, living unfortunately in an age of *collisions*, we are made uncomfortable by the phrase (p. 19): "This transformation collided with the chief motive." Nor does the phrase (p. 196): "That the beautiful, purposive as it may seem to us, must not serve any particular purpose," sound much happier. "Red-tapism" (p. 222) is a quite unnecessary stretching of the good old red tape. Whether "motivate" (p. 382), "motivation" (p. 138), will ever become standard, is a question we leave to the reader; but certainly "sonnetists" (p. 351) for the time-honored "sonneteers" is a gratuitous irritation.

The illustrations of the present volume strike us as less adequate than those of the first. The English title of Tischbein's painting is usually: Goethe *in* the Campagna.

Abraham Lincoln. By Carl Schurz and Truman H. Bartlett. Boston: Houghton, Mifflin & Co. $10 net.

Here are gathered in one sumptuous, superbly printed volume, Carl Schurz's biographical sketch of Lincoln, Truman H. Bartlett's essay on the portraits of him, Richard Watson Gilder's sonnet on the life-mask of the martyr President, and Edmund Clarence Stedman's poem, "The Hand of Lincoln." There are eighteen splendid illustrations, including some pictures that are relatively little known; and the history of all of them is told in copious notes. The Volk life-mask of Lincoln comes in for especial treatment; there are four engravings of it from different points of view, and it reappears again in profile, side by side with Houdon's mask of Washington. These two pieces are described as "the most important contributious yet made to American plastic portraiture." Whether one agrees with this dictum or not, the profiles of the two great Presideuts offer an opportunity for interesting study and comparison.

This treatment of the life-mask would of itself distiuguish the work before us; hut there are also two rare pictures, one taken in 1859, the other in 1861, the first wheu Lincoln was without a beard, and the second—far less attractive—when he wore a heavy, bushy beard, but shaved his upper lip. To most people the first of these two will, we think, appeal as perhaps the most winning of any of Lincoln's pictures, since it is full of strength, brings out all the sadness of the face, and yet portrays the clear-eyed and fearless tribune of the people. Two familiar pictures of special historical value are those of President Lincoln sitting in a teut with Gen. McClellan, and standing among his fifteen geuerals, just after the hattle of Antictam. Extracted from a group, there is another engraving of Lincoln, standing with an ugly hat and ill-fitting frock coat, a portrait which brings out the extraordinary length of his limbs. We can only wish that the publishers had included in this series, a reproduction of Saint-Gaudens's wonderful statue at Chicago.

Altogether, this is a volume that no one interested in the subject can afford to overlook. Schurz's trihute has an imperishable place in the literature of the subject. But were the contents of the volume less worthy, the book itself is an artistic achievement of which the publishers have every reason to be proud.

Science.

LORD KELVIN.

Sir William Thomson, Baron Kelvin, died December 17, after an illness of some weeks. He was the greatest reasoner of his time about physics, and at the moment of his death was, without dispute, the greatest scientific genius living. In the art of subjugating a question of practical physics and bringing it under the salutary domination of mathematics, it may be doubted whether history can show his equal.

He was born in Belfast, in 1824. His father had broken the ancestral line of farmers, and ultimately became professor of mathematics in the University of Glasgow. His brother, Dr. James Thomson, professor of civil engineering in Glasgow, made at least one important and penetrating contribution to mathematical physics—facts indicating a family bent in that direction. William Thomson was a precocious lad; but he retained through life a generous enthusiasm and a sprightly wit that gave him something of the charm of a boy. He entered the university at eleven years of age. He was twelve when the Glasgow circle received an accession in the person of J. P. Nichol, author of "The Architecture of the Heavens," who became a close friend of Thomson's father and of the boy. The latter, late in life, testified that the poetical imagination of Nichol had first fired him with devotion to physics, and that the same master's enthusiasm had incited him to study Fourier's "Théorie de la chaleur." From Glasgow he went to Peterhouse, Cambridge, where he was graduated in 1845 with high honors. Already he had an established reputation as a mathematical physicist. In 1841, at the age of seventeen, he had published an able memoir upon the conduction of heat and upon the connection between the mathematical theories of heat and electricity, involving, too, important new discoveries in pure mathematics. Another paper published by Thomson at the age of eighteen gave his method of determining geological dates by means of underground temperatures. Immediately upon his graduation, Thomson repaired to Paris and entered the laboratory of Regnault, who was then engaged in his fundamental determinations relating to the theory of the steam engine. In the same year, Thomson published in French his viudication of Coulomb's law of statical electricity, for the supposed refutation of which Sir W. Snow Harris had received the Copley medal of the Royal Society. Though Harris's conclusious were based upon an elaborate series of delicate measures, Thomson overthrew them with one blow, and that upon the strength of well-known experiments of a rudimentary nature. A logical objection has of late years been raised to Thomson's argument; yet those who bring it forward do not revert to Snow Harris's conclusion. Ten scientific papers, all of great merit, were published by Thomson the year of his graduation. The following year appeared his wonderful theory of electrical images, which is a geometrical method whereby a certain class of refractory problems about the distribution of electricity receive a solution. This excited high admiration among the mathematicians.

In 1846, at the age of twenty-two, Thomson was made professor of mathematics in the University of Glasgow, aud also editor of the Cambridge and Dublin *Mathematical Journal*. He soon began to produce his wouderful series of instruments for electrical measurement, and this modern art, with its extraordinary precisiou, owes far more to him than to any other individual. We now come to his researches upon heat, which contributed in no small degree to the progress of civilization, hoth directly and indirectly. Two theories of heat had been entertained from early times, the one, which is now current, that it is an agitation of the particles of the hot body; the other that it is a fluid. Sir Humphry Davy had advocated the kinetical theory, and Rumford had put it into a strong light by his experiments. Nevertheless, the difficulties of this hypothesis seemed to be such that the fluid theory generally prevailed. Sadi-Carnot had in 1826 published a great work upon the steam engine founded on the latter basis. Meautime, general ideas about energy were developing themselves. The now celebrated memoir of Helmholtz on the conservation of forces was published in 1846; but it failed to attract much attention. At length many things—Joule's determinations, certain confirmations of the kinetical theory by Regnault's researches, and the increasing importance of economy in steam engines—brought physicists face to face with the question, How is Carnot's theory to be amended so as to accord with the doctrine that heat is a mode of motion? It was Rankine in 1849 who first answered this question; but only upon an assumption quite unsupported by observed facts. The next year Clausius outlined the theory as it is held to-day, taking for his postulate that temperatures tend to equalize themselves by the flow of heat from hot to cold bodies. Thomson had worked out the problem independently from a slightly more cautious premise, before the memoir of Clausius appeared. This confirmation was useful in giving physicists confidence iu the analysis, and hastened the general acceptance of the modern doctrine. Thomson now became much occupied with the theory of heat. In 1852 he announced the principle of the dissipation of energy; that is, that there is a flow of heat from warmer bodies to cooler ones, which goes to waste, since it cannot be recouverted hy ordinary means into mechanical work. Thus, the whole universe would seem destined to become lifeless by the conversion of all energy into heat uniformly distributed throughout the whole. From 1852 to 1862 Thomson and

Joule published in collaboration ten memoirs on the thermal effects of fluids in motion. The most important result obtained was that the force between the molecules of an ordinary gas is on the whole attractive, and not repulsive, which was somewhat startling, in view of the expansive power of gases.

One of the first great enterprises with which Thomson was identified was that of the Atlantic cable. Electric signals sent through a submarine cable were found to undergo a peculiar retardation that threatened to blur them beyond recognition. Faraday had long before furnished a partial remedy, but Thomson supplied a complete one, so as to secure reasonably satisfactory clearness and speed. The correctness of his statement of the laws involved was disputed by an electrician of the cable company, Dr. Wildman Whitehouse, but the Glasgow expert disposed of the argument so effectively that he was retained on the spot as consulting engineer. He officiated in that capacity both for the cable of 1858 and that of 1866. He was also electrical engineer for the French Atlantic cable in 1869; the Brazilian and River Plate cable in 1873; the West Indian cables in 1875, and the Mackay-Bennett Atlantic cable in 1879. To the success of these enterprises he contributed in several other ways. He prescribed a method of testing the conductivity of a submarine wire while it was being laid, in order that any defect might be promptly discovered and cured. He also invented instruments to receive messages. Those employed for land wires were not sensitive enough. Thomson so mounted a mirror on a tiny magnet that the feeble electric impulses which traversed a cable would cause it to sway. A beam of light was thus deflected, first to the right and then to the left, on a blank white wall in a dark room. The magnet was suspended by a silk fibre, and its movements were practically unimpeded by friction. This invention was supplemented by one called the "siphon recorder," which would-leave a permanent trace on a strip of paper. Without question he did more than any other scientist to promote submarine telegraphy, and in recognition of these services he was knighted in 1866.

Thomson was an enthusiastic yachtsman, and did much for the marine art and science. He puhlished special tables to facilitate Sumner's American method of navigation; he invented the compass now generally used on shipboard, as well as the indispensable method for applying Airy's theory of the correction of compasses on iron vessels. He originated the only practical instrument for deep-sea sounding. He was also one of the chief investigators of tides; he invented the remarkable instrument called the harmonic analyzer, for mechanically determining the magnitudes and phases of the twenty or more different component oscillations which enter into the tide at each port. Thomson invented a number of other calculating machines, among them a tide-predicting machine, a machine for solving equations, and, in conjunction with his hrother, a remarkable mechanical integrator.

It is impossible to enumerate here all the lines in which our civilization is in debt to the labors of this indefatigable man. His genius was the dominating influence in investigation of questions relating to the age of the earth, its internal solidity or fluidity, and its rate of cooling. Another great field in which his was the leading mind was that of speculation about the molecular constitution of matter. Upon this subject he delivered a course of lectures at the Johns Hopkins University in 1884. He did much to illustrate the exceeding complexity of the problem, and to throw light upon parts of it, while leaving it as a whole unsolved. His last extensive experimental work related to the electrification of air; hut he still pushed analytical investigations when he had passed the age of eighty. Besides the treatise of Thomson and Tait, entitled "A Treatise on Natural Philosophy," but confined, in fact, to a part of analytical mechanics, Thomson wrote no books. His Baltimore lectures were reported and lithographed, his scientific memoirs were collected in three stout octavos, and his popular addresses in as many duodecimos. In 1877 he was made foreign associate of the French Academy of Sciences, usually counted as the highest of scientific honors. In 1892, he was raised to the peerage at the instance of Lord Salisbury. Baron Kelvin succeeded another illustrious mathematical physicist, Stokes, as president of the Royal Society. In his later years he was president of the Royal Society of Edinburgh.

The distinguishing characteristic of Thomson's intellect was his power of analyzing physical facts into their elementary components mathematically defined, and of identifying these components with those of other facts. He was a cautious theorizer, taking care not to lose sight of possibilities that other men might not think worth considering. His ingenuity was marvellous. His gyrostat, a thing that would stand in apparently impossible positions; his gyrostatic pendulum and gyrostatic chain, with their weird motions; his bag that would allow water to run in and out freely, and yet was absolutely impervious to air; his instruments for measuring temperature, his jelly model of a molecule, and his paper of February, 1894, on the partition of space (a crystallographic problem), may serve as examples. It is the men who have themselves achieved the most in science who will be most penetrated with admiration for Kelvin. But we can never give full credit to a great man's excellences until we have weighed his defects. Kelvin had become infected by Nichol with a bias in favor of the miraculous. Hence, many of the hypotheses by which he proposed to explain physical phenomena would, if admitted as facts, themselves clamor for explanation. We refer for examples to his theory of germs diffused through the universe, and to the idea that atoms are "manufactured articles." No hypothesis seemed too unaccountahle for him, so long as the observed phenomena would he necessary consequences of it. Because he was without a peer in that sort of explanation, because, after all, he did not succeed in explaining the constitution of matter (as he himself confessed), and because more evolutionary hypotheses are likely to he favored in the future, Kelvin's death may mark one of the great epochs in the history of our understanding of the physical universe.

The annual meeting of the American Ornithologists' Union, in Philadelphia, last week, December 10-12, was of greater interest than usual as the twenty-fifth anniversary of the founding of the union. About one hundred members were present and some twenty-seven papers were presented. There was a noticeable falling off in that uninteresting type of paper—local lists, and a reduction in contributions of purely systematic nature. In this systematic work American ornithologists have long led the world, and within the limited field they have accomplished much; but there is a welcome tendency, especially among the younger men, to broaden their research into other fields—notably in the ecological phase of bird study and in experimental investigation. The illustrated papers showed the highest excellence yet attained in photography of wild birds. One of the most interesting papers of a popular nature was Ernest Thompson Seton's account of the birds which he observed during a recent seven months' trip to Great Slave Lake, in northern Canada. What may he accomplished by modern modes of rapid transit was shown by Frank M. Chapman, who, during the present year, followed the progress of summer from the hreeding man-o'-war hirds and boobies of the Bahamas, north to the heron rookeries of the Southern States. Then swift trains took him to the plains of the Northwest and the summits of the Rockies. Here he again caught up with summer and took a series of remarkable photographs of nesting ptarmigan and other species. The material gathered by collector and artist will he used in the admirable series of hird groups which are being placed in the American Museum in this city. These groups will, when completed, have no equals in the world. Not only will they present a vivid idea of our larger typical American birds, but also a representative series of landscape backgrounds of the scenery of our continent from the Atlantic to the Pacific.

An addition to scientific literature comes in the form of the "Jahrbuch der drahtlosen Telegraphie und Telephonie," edited by Dr. Gustav Eichhorn of Zürich with the collaboration, among others, of Prof. J. A. Fleming and Dr. Guglielmo Marconi of London, and of Count von Arco and Prof. Adolf Slaby of Berlin. Four *Hefte* are to make one volume at a cost of twenty marks. The number before us contains, besides articles some of which can appeal only to the elect, a bibliography and book reviews.

The house of A. Haase in Prague announces a new journal called *Rundschau für Technik und Wirtschaft*, under the editorship of Prof. Alfred Birk of the School of Technology in Prague, who until now has been the editor of the *Zeitschrift für Eisenbahn und Industrie*, but has retired from this position.

A year ago Prof. Pierre Janet gave a course of fifteen lectures on hysteria at the Harvard Medical School, repeating them in part elsewhere. Some of them were fully reported in medical journals, but their publication in book form, "The Major Symptoms of Hysteria" (The Macmillan Co.), will obtain for them the larger class of readers that they richly deserve. The subject is developed in an entertaining way, with a remarkably ready use of English which has only an occasional slight obscur-

ity. Starting with monoideie somnambulism as the most characteristie symptom of hysteria, he passes on to the "fugues," or escapades (those startling forms of mental vagabondage), and multiple personalities (or "dominating somnambulism"), and then to what may be called the more local manifestations. Everywhere the reader finds some fresh and interesting presentation of the phenomena of a disease which should be better understood, and whose social importance can hardly be overrated. Ineidentally the question of hypnotism is discussed with the conclusion that it is "one of the most fundamental stigmata of the hysterical state." Janet insists that the definition of hysteria must be psychological, and he is impatient of physiological explanations; just at the end, however, he urges that these discussions are premature and concern purely verbal differences, so that the skeptie need not feel himself altogether disgraced. Janet's own briefest definition is that hysteria is a "malady of the personal synthesis," and his elaboration of this idea is worthy of careful reading.

An evidence of the lively interest felt in Polar exploration at the present time is to be found in the issue of a new edition of the monumental work of the leader of the National Antarctic Expedition, Capt. Robert F. Scott, "The Voyage of the Discovery" (imported by Charles Scribner's Sons). It apparently differs in no respect from the original edition, except that it is smaller in size and accordingly easier to handle and the illustrations are fewer in number.

Balloon literature is increasing in volume. We have before us "La Technique du ballon," by G. Espitalier (Paris: Octave Doin), forming part of the Encyclopédie Scientifique, edited by Dr. Toulouse. This is really a treatise on the mechanics of the balloon and of its accessories. Some idea of the scope and progress of the science may be formed from the subjects treated. To illustrate, we have chapters on the means of combating vertical instability, on the fatigue of the stuffs forming the envelope, and on the geometrical form of the balloon. The work is seriously mathematical. Of quite another character is Captain de Forge's "La Conquête de l'air" (Paris: Berger-Levrault). Compared with the text just described, this book is what the French themselves call an *ouvrage de vulgarisation*. But as such it is distinctly interesting and valuable, giving an account of ballooning (including aeroplaning) from its origin down to the present day. Naturally enough, the French point of view is always in evidence, foreign investigation as a rule getting but a short shrift. We note that our own Langley is, so to say, dismissed with "un Américain, Langley."

Major P. Charbonnier's "Balistique extérieure rationnelle" (Paris: Octave Doin) is issued in two separate volumes, dealing respectively with the principal and secondary problems of ballistics. Of the value of these books to the scientific artillery specialist, there can be no question. But we should like here especially to point out the interest these works should have for the physicist pure and simple. The motion of a projectile is really planetary, complicated by the resistance of the medium in which it takes place and by the rotation of the earth itself. The problem so far has defied general solution. The examples and exercises originated and collected by Major Charbonnier command attention as being neither numerical tests, on the one hand, nor mere mathematical gymnastics on the other.

Drama.

For the closing performance of his engagement at the Lyric Theatre, Ermete Novelli selected Shakespeare's "Macbeth," and his impersonation of the guilty Thane lent strong confirmation to the accuracy of the opinion already expressed in these pages that his great histrionic capacity, manifested so vividly in romance, melodrama, and a very wide range of comedy, is unequal to the higher flights of tragedy. Notable as his Shylock was in many respects—in cunning, malevolence, frenzied passion, and grovelling despair—it lacked the touch of imagination which gave forlorn dignity and pathos to the conceptions of Booth and Irving; and the want of this refining and ennobling influence was still more noticeable in the far greater and loftier characters of Othello and Lear. In his Macbeth there was an almost total absence of it. In common fairness it should be remembered that he is probably but imperfectly acquainted with English traditions or commentaries; and that his ideal was formed chiefly from a lacerated text only dimly suggestive of the original, but if he possessed the intuition or the insight of the true tragedian, the general plan of the piece, and the preternatural machinery employed in it, would have prevented him from playing it along the lines of ordinary blood-and-thunder melodrama. In his case there can be no question of insufficient technical resource. No living actor is better equipped than he with the means of emotional interpretation. In figure, voice, eloquence of gesture, and extraordinary control of facial expression, he has all the essential qualifications for acting of the highest order. His weakness lies in the limitations of an intelligence almost wholly realistic and theatrical. The same failure of perception that robbed his Shylock of distinction, his Othello of dignity, and his Lear of grandeur and pathos, made his Macbeth au abject cut-throat of hang-dog aspect and manner, showing no attribute of either soldier or tyrant. This low ideal was presented with an exaggeration that occasionally trembled on the verge of burlesque, but afforded some wonderfully picturesque attitudes and most impressive facial play. Some excellent work was done by the supporting cast. Signora Giannini's Lady Macbeth showed comprehension, Signor Piamonti was an admirable Duncan, Signor Betrone a good Macduff, and Signor Férrati an effective Banquo.

Beerbohm Tree has determined to open his London season with Comyns Carr's play, "The Mystery of Edwin Drood," on January 4. Mr. Carr's conclusion of the story is bold, if not convincing. According to him, Jasper, while under the influence of opium, dreams of murdering Edwin, and so horrifies the latter—who is a witness of his ravings—that he seeks safety in flight. Jasper awakening, and missing Edwin, is straightway convinced that the supposed dream was a reality, and that he has actually concealed Edwin's body in the crypt. Finally he is tricked into a confession by Grewgious, and at the critical moment Edwin returns. Jasper, believing him to be a ghost, dies of the shock. Few students of the problem will be satisfied probably by this solution, but Mr. Tree is credited with a vivid and powerful performance of Jasper, and it is plain that such a character would be well within the range of his abilities. Later in the year he will produce Stephen Phillips's "Faust."

Music.

Irish Songs. Edited by N. Clifford Page. Boston: Oliver Ditson Co. $1.25.

Piano Compositions of Johann Sebastian Bach. Edited by Ebenezer Prout. Boston: Oliver Ditson Co. $1.50.

Two opposing tendencies may be noted in the musical world to-day. One is in the direction of the contrapuntal complexities of Richard Strauss and Max Reger and their imitators; the other is a return to the old folksongs of various countries, those inexhaustible treasures of undiluted melody and genuine feeling. It is easy to foretell the issue: simplicity and sincerity will once more oust ingenuity and artificiality; the renewed contact with early folk melody will give the strength to push aside the mere puzzle music of our day. Every new volume of popular melodies must therefore be welcomed as an aid in a good cause.

No European country has a richer store of national melody than Ireland, or one more racy of the soil. There have been prominent Irish composers, too—John Field, Balfe, and Villiers Stanford among them—but the best specimens of the Irish melody are nevertheless in the old songs, the creators of many of which are unknown. Of this fact any one can convince himself by looking over the new Ditson collection. This embraces not only the best loved songs of Ireland, but a number of others that only need to be known to be equally loved; they have the true Celtic flavor. A few modern songs have also been added. Mr. Page has adopted in some cases the accompaniments supplied by Stanford, Balfe, and others; in many instances he has himself arranged the piano parts, usually in good taste, although in a few numbers ("As I went awalking," for instance) the accompaniment, though admirable considered in itself, is not quite in keeping with the simple style of the song. The book is tastefully bound in holiday dress.

The complete collection of Bach's works, published by the Bach Society, includes thirty-five large volumes of vocal and nineteen of instrumental music. Of the vocal works all but a fraction are still music of the future. Of the instrumental pieces a much larger number are known, being played in concert halls with increasing frequency. There are indications, too, that more and more amateur pianists are following Schumann's admonition: "Make Bach your daily bread." Of no composer can it be more truly said than of him that *l'appétit vient en mangeant*. This accounts for the multiplication of editions of Bach's pieces for clavier (clavichord and harpsi-

chord) which are now played on the pianoforte. Among these editions none is more commendable than that of Professor Prout, the eminent English theorist and composer, which is the latest volume in the Musicians' Library. It contains a large number of the shorter compositions, the longer ones being reserved for a later volume. We find here, as a matter of course, the Six Little Preludes, the Twelve Little Preludes; also fifteen "Inventions" and so-called "Symphonies," which the editor has grouped effectively. Besides these there are a large number of old-fashioned dances—minuets, gavottes, sarabandes, gigues, etc., selected, or as presented in four of the French Suites. These dances show the gay and genial side of Bach's genius. They are far from being mere "bagatelles," like Beethoven's short pieces, but, like those of Schubert, they are often as truly inspired as the weightier works.

The selection of Professor Prout as editor of this volume calls for special commendation, because, in the case of Bach, the editor has unusual responsibilities. It was not customary in Bach's day to give in the written or printed music any indications as to the pace or the degree of loudness wanted. The editor has in these respects followed his own judgment, going so far as to add even metronome marks. These, of course, the player need not accept; but, unless he himself is an expert in the interpretation of eighteenth century music, he will do wisely to follow the lead of the eminent English scholar. Only in one respect does Professor Prout fail in his very valuable and detailed introduction to this volume: he gives no intimation to the student as to what to do in regard to the pedal. In Bach's day pedals did not exist, but there can be no doubt that he, who really wrote not for the clavichord of his day, but for the pianoforte of the future, would have used the pedal, had he had one, as freely as Chopin used it; not only for prolonging chords, but for securing a rich and varied tone color by the sympathetic commingling of overtones. By using the pedal in the modern way in the third of the Twelve Little Preludes (p. 9), we can make this piece superbly effective. With its aid, too, the following one can be made to sound as modern, as beautiful sensuously, and as dreamy in sentiment, especially in the last three bars, as a Chopin nocturne.

Grieg is dead, but the world has not yet seen all the products of his unique genius. In the first December issue of *Die Musik* Julius Roentgen has an article devoted to Grieg's musical remains, whence it appears that some very interesting novelties are yet to be published. The composer had the sketches or complete copies of these in three albums, which he always took with him on his tours, so as to be able to give them the benefit of every hour that he felt capable of working. These hours were infrequent in the last years of his life, because of the very precarious state of his health. Nevertheless, a few compositions were left ready for the printer. Among these is a series of songs of the years 1865-1905, which are to appear in two sets. Then there is an andante for piano, violin, and violoncello, which Roentgen considers worthy of perpetuation; also the first two movements of a quartet, which are "among the most fascinating things Grieg has written." It appears that Grieg had planned an oratorio ("Peace"), for which Björnson had, at his request, written the text. But when the poet wanted this text to be printed before the music was written, Grieg lost his interest in it; he never wrote more than one air, which will be printed with the songs referred to. Finally, there is a good deal of the incidental music to "Peer Gynt," which has never been printed, although the two suites made up of this music enjoy great popularity. It was one of Grieg's favorite ideas to have a special edition issued of all this music, for concert performances, the connecting text being spoken. This plan is now to be carried out by his publisher.

Art.

Westminster Abbey and the Kings' Craftsmen: A Study of Mediæval Building. By W. R. Lethaby. New York: E. P. Dutton & Co. $3.50 net.

Westminster Abbey, on account of its associations, excites more general interest among English-speaking people than any other building of the Gothic period; and architecturally, also, the building is of great importance. Several admirable books have already been published on the subject. One of the best is the "History of Antiquities of Westminster Abbey," with engravings from drawings by John Preston Neale, a small folio, published in 1823, and republished at intervals since; the engravings are of the well-known style of the early work of John Britton, and are less refined than those of Billings. A later work, by J. T. Micklethwaite and H. J. Feasey, is illustrated by many photogravure plates, to which are added four indifferently good plans. On account of this already rather full illustration, Mr. Lethaby was not called upon to furnish a great number of precise reproductions. Small half-tone prints could perhaps have been inserted in his text to advantage, because only those persons who make architecture a special study are likely to purchase the older folios. But such illustrations would have made the book different from what the author proposed.

His object is chiefly to trace the names, the lives, and the remaining work of those artists and artisans who labored upon the church, its accessories, and its surroundings. He says in his preface:

> Just as in thirteenth-century Italy we assign certain works of art to Arnolfo, Niccolo, or Giotto, so here we can identify the works of John of Gloucester, mason; John of St. Albans, sculptor; and William of Westminster, painter.

The work of these men is, then, the subject of the heart of the book, chapters vi., vii., viii., and indeed, all that follow, except as kindred subjects are introduced. Another purpose of the author is stated as follows in the preface:

> I have wished also to get at the facts as to building organization in the Middle Ages—the "economic basis" of Gothic art. If this is understood, it seems to me that the futility of copying the mere shapes taken by this great historical art must be acknowledged. The more we imitate the works of the men who wrought the marvels of Gothic art, the less we have of their spirit, for they advanced into the unknown.

These words suggest an almost mystical way of regarding works of art, a point of view which can never be disregarded; for it is held by the most intelligent and devoted students. The theory applies, however, more to the future builder, the possible designer in the Gothic spirit, than to the student of existing monuments. A more commonplace way of expressing this notion is perhaps to say that the way to design in the Gothic style is to become extremely familiar with many buildings of ancient times, to try to classify them, to follow out their minute details, to live with them and to grow to feel their full significance—then to shut up the books, to close the portfolios of photographs, to go out on the open ground, and later upon the scaffolding, and plan the new building for yourself.

For the enlightened study of Westminster Abbey, chapters i. and ii. may serve as a guide, while chapters iii. to v. inclusive afford an historical record of the building. Chapter vi. deals with "Points of Construction," and will be thought by many readers the most important in the book. The restorations, the renewals, the rebuildings, the modernizations to which the unhappy church has been exposed, have not affected its structural character; and the twenty-three pages devoted to this subject are a compressed and lucid account of the building in the stricter sense of the word. It is pleasant to see, in this connection, that Mr. Micklethwaite, author of the larger book cited above, is referred to on many occasions as having greatly advanced the study of the Abbey Church, and is mentioned in page 147 as "almost an infallible authority on the Abbey." Chapter xi. is devoted to a structure which is not in a strict sense a part of the Abbey Church, that is, the building which Mr. Lethaby likes to call the Lady Chapel. This term is more often used in England than on the Continent; it refers nearly always to a building carried out eastward, as this one is, from the choir and sanctuary. This Westminster addition is commonly named the Chapel of Henry VII., and it was, as indeed our author says, "built wholly in the sixteenth century"—more than two hundred years after the Abbey Church was complete. The charm and value of the thing, however, are in this: "It was built without any taint of the Renaissance," by which is meant the classical Renaissance, which, in the sixteenth century, had spread all over western Europe. This great chapel is indeed an important instance in England of the late and florid Gothic, that which some French writers include in their own term, *La Renaissance*, as expressing the fact that it arose after the Gothic style, properly so called, had run its course, developed, and declined. Now there are in England two or three other buildings fit to rank with this; and one of them at least, King's College Chapel at Cambridge, is more beautiful in general interior effect. Nevertheless the chapel at Westminster must be regarded as the most important of them all, partly because of its plan and structure with an admirable stone roof, one of the four perfect pieces of fan vaulting in existence, partly because of the "very beautiful bending of the external wall into a series of bay windows," and partly because "of the profusion of the finely arranged and well

wrought sculptures." It has been Mr. Lethaby's delight to compare this chapel with St. George's at Windsor Castle, and to find close resemblances. Brutal restorations under Wyatt at the beginning of the nineteenth century are described as having been so complete that, at least as regards the exterior, "it is now only a full size copy of itself." On the other hand the statues in the interior, nearly a hundred in number, "form our largest assemblage of sculptured saints after those on the west front of Wells," and they are pronounced to be generally in good preservation.

The book is fully illustrated by 124 inserts in the text, generally in the form of diagrams, but also in the way of small drawings showing care for fidelity in reproduction. These drawings represent the patterns of ornamental glass and of mosaic pavements as well as constructional diagrams.

We may accept the book as the latest utterance of a highly trained, thoughtful, enthusiastic student of mediæval art, and may read in it, not merely an account of that one important monument which he has chosen to illustrate, but of the whole style or series of styles which it embodies. This book and others of its kind indicate that the modern world of architecture, chaotic and revolutionary from having no laws which any two students can interpret alike, is in the way of meeting with a new influence—that of the twentieth century mediævalists. The failure of the Gothic Revival begun before 1850 does not discourage the preachers of this new gospel, because they see that the study then given to the Middle Ages was inadequate in knowledge and insight, and that the greater part of the work done under its influence from 1850 to 1880 or thereabouts was too much in the way of formal copying without much intelligence as to the examples chosen or the copies made. Whether such writers as Mr. Lethaby and Ralph Adams Cram of Boston will succeed in taking with them into the field of mediæval study any large number of the young professional architects is as yet uncertain, but the movement is being urged fearlessly and thoroughly.

One wonders why the Century Company should consider Timothy Cole's volumes of engravings after the masters in need of the kind of perfunctory text which Charles H. Caffin has supplied to that on "The Old Spanish Masters." Mr. Cole's own notes are much more interesting reading, and supply all that is necessary in the way of commentary—often, even, the very facts that Mr. Caffin gives in different words in his respectable compilation. The chapters on earlier Spanish painters do, indeed, give some facts not to be found in Mr. Cole's notes, for the very sufficient reason that these painters were not engraved by Mr. Cole, and have consequently no proper place in the volume. There is nothing in these or any of Mr. Caffin's chapters not readily to be found elsewhere. Of the engravings themselves it is hardly necessary to speak. They have all Mr. Cole's mastery of methods and richness of tone, and all the inevitable unsatisfactoriness as reproductions of the originals inseparable from such interpretations of one artist by another. For one who would understand Velasquez or Murillo they are not what is wanted. For the connoisseur of wood-engravings in the modern American method they are a delight.

The latest addition to the Langham Series of Art Monographs (Charles Scribner's Sons) is a grandiloquent little book, "Pompeii as an Art City," by E. von Meyer. It gives many reflections on Hellenism and the philosophy of life in an intolerably wordy style, but contains remarkably little information about Pompeiian art.

"Scarabs: An Introduction to the Study of Egyptian Seals and Signet Rings," by Percy E. Newberry (London: Constable & Co.) contains nearly two hundred and fifty pages, with forty-four plates and one hundred and sixteen illustrations in the text. Of all the antiquities of Egypt the one which is most sought and which lends itself most readily to purposes of personal adornment in rings and brooches or bracelets, is the scarab. There is also no other so often and so successfully imitated. In fact, it is sometimes impossible for any but an expert to detect the forgery. The scarab was put to different uses, now as a record of an historical event, now as a charm or amulet, but most frequently as a seal. Some contain good wishes addressed to individuals or unaddressed. Some contain the names of kings, and seem to have had a sort of eschatological significance, as though they would place the owner under the protection of a monarch dead for a longer or a shorter time. Some have merely fanciful or scroll designs, and others again bear legends that defy translation or interpretation. During the long periods of Egyptian history from the eleventh to the twenty-sixth dynasty, they were made in myriads. In the course of centuries the pattern changed constantly, though the general design persisted. By the back of the scarab its age may be fixed approximately, though wide experience is needed to enable one to judge. It is to the exposition of the significance of the scarab as a seal that the author has addressed himself. It is little to say that he has produced the most valuable monograph that we have on the subject, as far as Egyptian practice is concerned. Beginning with the importance attached to the seal in ancient times, he proceeds to treat of its origin and uses, of the officials who were empowered to affix it, and of the methods of its manufacture. The various forms which the seal assumed, beginning with the cylinder and passing through various shapes to the signet ring, are described. More than half of the text is devoted to descriptions of the samples figured in the plates. These figures number about thirteen hundred, being selections from some seven thousand drawings and from an examination of over thirty thousand examples. The book is thus authoritative, based on a wide study, and as trustworthy as any book on the subject can be made. It is not too technical for lay comprehension, and may be consulted with confidence.

In the London *Times* is printed a statement made by Signor Rava, the minister of public instruction, before the Commission of Fine Arts, which goes far to remove all reproach which has hitherto been levelled against the Italian neglect of artistic treasures. The branch of his ministry which deals with the fine arts had, he said, for the first time since the constitution of the kingdom of Italy, been put on a solid footing, with an increased grant for salaries of $80,000 a year. There had also been placed at its disposal a sum of $1,000,000 for the purpose of making purchases of works of art. A special council would be entrusted with the control of this fund. Legislation would also be laid before the chamber to dispose of the legal difficulties which beset the preservation of monuments and any other objects of artistic value. To this preservation his ministry had already contributed by grants of money to municipalities, ecclesiastical communities, and other corporations. Signor Rava specially instanced the case of St. Mark's, in Venice, for which Parliament would be asked to grant a considerable sum in aid of that already promised by the Venetian municipality. Other arrangements were being made with the same municipality for the repair of the Abbey of San Gregorio, and with the municipality of Ravenna for the preservation of the famous cloisters of San Vitale and Santa Maria in Porto. The Palazzo Ducale of Gubbio would also be restored and converted into a museum. In the matter of archæology, Parliament had voted means for buying and isolating the area occupied by the Baths of Diocletian. The ministry was fully prepared to buy any statutes or other objects of sufficient value which were discovered in excavation. The recent purchase of the statue found at Anzio was delayed only by the legal question as to the actual owner. Funds had been granted for conducting excavations in Sicily. We know also that Signor Rava has prepared a bill on the subject of the much discussed excavations at Herculaneum. The chief provisions of this bill are, first, the appropriation of $100,000 to begin the expropriation of the land and buildings of Resina, the town which stands over Herculaneum; secondly, the appropriation of $3,000 yearly for carrying on the work of excavation, which sum does not include the salaries of the officials engaged in it. A special commission, under Professor de Petra of the University of Naples, has undertaken the preliminary studies with the view of beginning the work as soon as possible, and has already sent several reports to Signor Rava, with important projects and estimates.

Prof. Charles Waldstein protests vigorously against the indifferent attitude of the British government toward Dr. Arthur J. Evans, the well-known archæologist, and his work in Crete. Professor Waldstein says in the London *Times:*

It is sad to think that one who has rendered such brilliant services to science with such devoted work and expenditure of thought and talent and his own material means should have to appeal for support in order to complete a scientific labor which has brought credit to the British nation all over the world. In any other European country the government would have subsidized, if not paid, all the expenses of what can in no way be considered a private enterprise. There can be no doubt that Dr. Evans's Cretan excavations rank highest in importance among all the works of archæological exploration in our day. It is well known that he has himself borne the greater part of the expenses for several years. Those who have hitherto supported him belong chiefly to the academic world or the world of scholars—people who are al-

ready overburdened with contributions of a similar nature out of all proportion to their incomes. Does not a wider public take some interest in the higher research carried on by the scientific representatives of the nation, and can the wealthier classes in England not be brought to give material support to the efforts of those who thus stand for the nation's higher culture? Is it impossible to hope for a government subsidy? If it be not the "tradition," good traditions can be inaugurated by those who lead the nation.

The opening day (December 4) of the sale of the Rikoff collection at the Hôtel Drouot in Paris gave some interesting prices for old masters of the Dutch and Flemish schools. Although the prices were paid for the most part by international dealers of Paris in competition with Amsterdam, enough amateurs were bidding to show the genuine value now attached to such paintings. Terburg's Woman with a Fan went to a Paris dealer for 43,100 francs. A Paris amateur, M. Boyer, paid 33,000 fr. for J. Ruysdael's Winding Road in the Forest. This painting was sold for 6,100 fr. at the Patureau sale, just fifty years ago. The Players at Ninepins of Jan Steen and Berckheyde, which was put up for sale at 6,000, went after a lively contest to Frederic Muller of Amsterdam for 30,000 fr. M. Muller paid the same price for Van der Heyden's View of a Canal in Holland, which brought only 14,100 in 1881 at the Beuronville sale. Wynants's Leafless Tree went to an amateur for 10,600 fr., as against 8,200, which it brought in 1876 at the Schneider sale. A. Van der Neer's Sunrise, for which 10,000 was asked, and which was sold for 10,300 in 1881 at the Roxart de La Salle sale, brought 28,100 fr.; and A. Van Ostade's Man at a Rustic Window, which was sold for 9,000 at the Wilson sale in 1881, reached 16,500 francs. Van Goyen's View on the Meuse brought 14,000 francs; and a number of other paintings went for higher prices than were asked. The total sale shows a distinct rise in these schools.

At Christie's auction rooms in London on November 27 the following prices were paid for etchings: A. H. Haig, Interior of Burgos Cathedral, £48; Mont St. Michael, £44; D. Lucas, after Constable, Salisbury Cathedral, £94. On November 30, Birket Foster's drawing, The Chairmender, brought £204; and J. Vincent's painting, A View on the River Yare, near Norwich, £420.

The Pennsylvania Academy of the Fine Arts will hold its one hundred and third annual exhibition January 20 to February 29, consisting of original works by American artists in oil painting and sculpture, which have not before been publicly shown in Philadelphia. The committees are as follows:

Painting: John W. Alexander, chairman; Thomas P. Anshutz, Richard N. Brooke, Colin Campbell Cooper, Howard Gardiner Cushing, Henry Golden Dearth, W. W. Gilchrist, jr., Philip L. Hale, Ernest Lawson, Willard L. Metcalf, and Charles Morris Young.

Sculpture: Daniel C. French, chairman; Bela L. Pratt, and Albert Laessle.

Hanging: John W. Alexander, Thomas P. Anshutz, and Willard L. Metcalf.

The seventy-third annual exhibition of the Architectural League of New York will be held in the building of the American Fine Arts Society February 2. Lectures on architecture will be delivered on Wednesdays, February 5, 12, and 19.

An exhibition of water colors will be open at the Salmagundi Club till December 24. Among the pictures at the dealers' shops are paintings by Childe Hassam, Montross's, December 28; old English mezzotints, M. Knoedler & Co.'s; and modern mezzotints, W. K. O'Brien & Co.'s.

Dr. Wilhelm R. Valentiner of Berlin has been appointed curator of decorative arts in the Metropolitan Museum of Fine Arts. His term is to begin as soon as his present engagements will permit. Dr. Valentiner is now the private assistant of Wilhelm Bode, director-general of the Royal Museums of Berlin. He was recommended to the trustees of the Metropolitan Museum by Dr. Bode himself, whose recommendation was warmly seconded by Julius Lessing, director of the Kunstgewerbe Museum in Berlin. Roger E. Fry, finding that he cannot stay in New York for so long a time as the responsibilities of the position demand, has been appointed European adviser of the museum, instead of curator of paintings. Bryson Burroughs, who for the last two years has filled the position of assistant curator, has been appointed acting curator of paintings.

Benjamin Champney, the landscape artist, died at Woburn, Mass., December 11. Born in New Ipswich, N. H., in 1817, he entered the Pendleton lithographic establishment in Boston at the age of eighteen; and there received his first training in draughtsmanship. In 1841, by the advice of Washington Allston, he went to Paris to pursue his art studies. He exhibited pictures in the Salons of 1844 and 1845, and visited Switzerland and Italy. He returned to this country in 1846, but went to France again in 1847, and spent the summer sketching along the Rhine. In 1853 he turned to the White Mountains, and sketched in and about North Conway. To this pleasant painting ground he came back year after year, bought a cottage there, built a studio, and made it his summer home. In 1865 he went abroad again, worked in Switzerland and among the Italian lakes; and in 1866 he spent the summer in Brittany. He was one of the charter members of the Boston Art Club, and one of its early presidents. In 1900 he published "Sixty Years' Memories of Art and Artists."

Mario Raggio, the sculptor, has just died in his eighty-seventh year. He was born in Carrara, and came to London in 1850, where for a while he worked under Matthew Noble. Among his most important monuments are the Beaconsfield memorial in Parliament Square, the statue of Archbishop Tait in Edinburgh, and the Jubilee memorial of Queen Victoria at Hongkong.

The death of Paul Ritter, the artist, is announced from Nuremburg. Ritter was born in 1829, and was from his fourth year a deaf mute. He studied under Heideloff and Korn.

Finance.

WHO WAS RESPONSIBLE FOR THE PANIC?

It is the uniform experience that in crises like the present all sections of the community, all groups of capitalists, and all existing powers that be, public and private—regardless of past jealousies and grievances—pull together. The October panic brought J. Pierpont Morgan, John D. Rockefeller, and the Federal Administration into cordial personal coöperation in measures of relief. No contrast could have been greater with 1903, when what was then ostentatiously called "the panic" was distinguished chiefly by efforts of one group of powerful millionaires to cut the ground from under the feet of rivals. Banks and trust companies, which in 1903 were engaged in mutual accusations, were working shoulder to shoulder last October, in an effort to save the very institutions on whose practices, four years before, the bitter controversy had focussed. The East and the West, which are always charging each other with vicious methods in finance, discarded personalities and labored for a common end.

But such things are too good to last. Disappearance of the actual danger starts the discordant discussion as to who was to blame. The East and the West are always first to resume their chronic recriminations. New York has now for a fortnight been alleging that the Western banks laid hands on the country's money when it was most acutely needed, and hoarded it in vaults; the West retorts that this was a "Wall Street gamblers' panic." Voicing the Western feeling, Charles A. Prouty of the Interstate Commerce Commission declared last Thursday in his speech to the Economic Club of this city:

> This present condition of things is very properly called a panic, an unreasoning and groundless fear. I don't know much about it, but as far as I can see it originated right here in New York. The people here in New York made up their minds that their money in your banks would be safer if they took it out and put it in their pockets, and the rest of the country had to suffer.

Now on these allegations the rather obvious comment is that they both have this much of basis—that if depositors in the trust companies had never indulged in a run, we should not have had just the "trust company panic" that came; and that if the Western banks had allowed their reserves to run down lower, there would have been more ready cash for other communities. But this is only saying that a run of depositors is a sign of panic, and that so is hoarding of cash—two facts which nobody has disputed.

But sectional recrimination takes a secondary place, in this process of hunting scapegoats, to the sudden outcry that the head of the government is to blame. Ex-Gov. Frank S. Black, addressing the New Hampshire Bar Association Thursday, gave out these dark hints:

> Some day, perhaps to-morrow, those shrivelled values of the innocent investor will pass on to his widow and his children. Will their lot then be cheered by the endless chain of threats now circling round the White House against the "wealthy malefactor" who still unpunished walks the streets and plies his trade?

Congressman McCall, speaking the same day at New York, remarked:

> Gentlemen very prominent, very responsible for the administration of the government of this nation, have taken an attitude with reference to property and enterprise that it seems to me has made this panic inevitable.

It is plain enough at whose head these blows are levelled. Now, no one familiar with previous history will imagine that the fixing of responsibility on the President is new to the present generation. Wall Street itself, which had been ardent in admiration of President Cleveland during all of the previous decade, turned to a furious denunciation of his policies when it was hunting a scapegoat for 1893. "Anything to beat Grant!" was the cry which reached the ears of the popular idol of four years before, when the country's financial interests began to pick up the fragments after September, 1873. When Buchanan received at the White House the returns from the election of 1857 in his own State of Pennsylvania, he and his Cabinet are said to have broken into laughter at the absurd completeness of their overthrow. A few weeks after the panic of 1837, the New York Merchants' Committee of Fifty solemnly embodied this query in their resolutions:

What Constitutional or legal justification can Martin Van Buren offer to the people of the United States for having brought on them *all* their present difficulties?

People who read history are now fairly well agreed as to what really did cause the panics of 1837, of 1857, of 1873, and of 1893, and they certainly have not reached the conclusion that the culprits were Martin Van Buren, James Buchanan, Ulysses S. Grant, and Grover Cleveland. The stage of sober history, perhaps, has not yet been reached in the matter of the panic of 1907. So long as the discussion runs on the present lines no particular interest will be aroused by insistence on what was visibly done to impair our credit system, and pave the way for last October, by the Captains of Industry whose activities, in the spring of 1901 and the autumn of 1906, were the marvel of the world. In all the other periods referred to, we had very much such militant leaders of finance; they did the same work in bringing on trouble, and when the crisis came, their voices were raised as conspicuously as now in the chorus of denunciation of the powers at Washington. After a while, financial history gave the Captains the rating which belonged to them, and which they will get in the sequel of 1907.

BOOKS OF THE WEEK.

Allen, Alexander V. G. Phillips Brooks, 1835-1893. Dutton. $2.50 net.

The Nation.

NEW YORK, THURSDAY, DECEMBER 26, 1907.

The Week.

If Gov. Cummins of Iowa is correct, the Presidential campaign next year is to be a battle of metaphysicians. This would follow from his definition of the issues. There is to be, first, the Democratic idea of tariff revision in a deadly struggle with the Republican idea of tariff revision. The one would be absolutely fatal to the country, the other is necessary to its salvation; yet which is which, and how one is distinguished from the other, it would take a prince of the scholastics to decide. Hence we say that the outlook is good for philosophers on the stump next year, able to divide a hair 'twixt north and northwest side. Their services will also be in demand if Gov. Cummins's other issue is to be understanded of the people. This is the Democratic plan of regulating corporations, in conflict with the Republican plan of doing the same thing. Of course, we should scarcely survive if the former were foolishly adopted, while we shall die prematurely if the latter is not; yet the two look as much alike as two peas. Some miraculously intelligent voters may be able to make the proper choice, but the run of them, we are sure, will need the aid of men skilled in pointing out the difference between tweedle-dum and tweedle-dee.

Although the new rules of the Republican party reduce by a total of eight votes in the convention the potency of those political divisions which either cast no electoral votes at all, or will certainly give theirs to the Democrats, these continue popular subjects of speculation. The Territories, which had a total of 42 delegates in 1904, including those from Porto Rico and the Philippines, will this year have but 14, which would be negligible in any but a very close contest. For Southern Republicans, however, the National Convention provides one crowded hour of glorious life. The six States of Alabama, South Carolina, Texas, Georgia, Mississippi, and Arkansas can in the convention outvote by 14 the combined delegations of California, Nebraska, Massachusetts, New Jersey, Kansas, and Connecticut. In the last Presidential election the former group cast 150,308 votes for Roosevelt, the latter 1,168,752. Thus, if we take these two groups as typical, one Southern delegate represents 1,073 individual Republican voters, while a Northern delegate represents 9,276. It is logically nine times as much honor for a candidate to win a delegate from a Northern State, but, on the other hand, his work counts for nine times as much if it is expended in that sunny region where the air tingles now with rumors of plot and counterplot.

A political writer recently expressed the desire to see a direct contest between the "new Federalists" and the "new anti-Federalists." If all the Democrats and all the Republicans who believe in confining governmental functions within the narrowest practicable limits should get together on one side, while all the Democrats and all the Republicans who believe in a considerable extension of governmental functions lined up on the other, the next election might demonstrate the true feeling of the American people about a question which underlies most of the particular issues of the day. As matters stand now, Democrats have lent a hand in most if not all of the new Federal policies, of which the most prominent critic at the moment happens to be Senator Foraker, a Republican. But the citizens interested in this question are not the only ones to talk about new alignments. We are told that if all the "friends of labor" would only vote the same way, they could overcome anybody and everybody. This view was rather discredited by last year's elections. Tariff reformers who know how serious is the Republican discontent with the stand-pat policy, wish devoutly that there could be a fresh alignment on the tariff issue, and would willingly let the Democratic protectionists join with Cannon and Payne and the others. Despite these wishes, however, any general re-alignment in 1908 is unlikely. Not long after Roosevelt's reëlection, many prophets were ready to predict a break-up of the old political parties. Some foretold a long era of good-feeling under a semi-paternal government, while others saw the immediate joining of battle between the corporations and the common people. Both agreed that neither the Democratic party nor the Republican—apart from the man it had placed in the Chief Magistracy—was worth saving. But all the political reporters are now predicting the liveliest convention the Republicans have held since 1892. And the Opposition is not to be a new or nondescript aggregation, proletariat or corporate, but the same old Democratic party. There will be no new alignment except in the wholesome sense that unattached voters will change their minds and shift according to their new convictions. They will, as usual, hold the balance of power between the immobile and disciplined bodies of straight party men. Not even Roosevelt with all his muckrakers, on the one hand, or Harriman with all his conspirators, on the other, has been able to do more than ripple the deep current of our system of two-party government.

In Attorney-General Bonaparte's address at Chicago last Saturday, he was filled with the idea of enforcing the law without fear or favor. He spoke, however, as if there were almost a general conspiracy to prevent the Administration from executing the laws, or to bring it into discredit if it did. The Department of Justice could not move against a great corporation without being accused of undermining prosperity; against land monopolists, without being charged with persecuting "prominent and useful citizens"; against peonage, without being blamed for hostility to an entire section of the country. Freely admitting, as we do, the importance of many of the Administration's attempts to apply the law—as in the Northern Securities case—no one who scans the record will concede that the statutes have been invariably executed. In the Paul Morton case, the specially designated assistants of the Attorney-General urged a certain course as the only way in which to establish the criminality of a friend of Mr. Roosevelt's, but the owner of the brotherless spear refused to let the law take its course. Moreover, the National Bank Act provides that "every person, firm, association, other than national bank associations, and every corporation . . . shall pay a tax of ten per centum on the amount of their own notes used for circulation and paid out by them." That is perfectly explicit. It makes no allowance for times of money stringency. Indeed, one of Mr. Bonaparte's subordinates in Texas proposed last month to collect this tax, as it might have been collected in many parts of the country. But Washington did not move. This particular law was, for the time being, made a dead letter by the Department of Justice. We do not say that this should not have been done. If the 10 per cent. tax had been rigidly levied upon all the scrip and corporation checks afloat as currency, there would have been an indignant outcry, and monetary recovery would have been retarded. But this very fact shows that law enforcement is not so simple a thing as is sometimes alleged. An executive cannot do his whole duty by merely looking into the statute-book, and decreeing that every law found there shall be always and everywhere enforced to the very letter. Capriciousness, or personal favoritism, in one set for the execution of the laws, is, of course, intolerable, but he is bound to use a certain amount of prudence even in law enforcement. This is rec-

ognized by Attorney-General Bonaparte, even in the fury of his argument, when he adds that, of course, people must not "demand impossibilities."

The Governor of Nevada presents himself in no enviable light. He called upon the President for aid, apparently when in a state of terror at the prospect of a revolution. So Mr. Roosevelt properly and promptly responded by hurrying troops to the scene of impending war, only to find that everything was quiet. Naturally, Mr. Roosevelt feels indignant, particularly as Gov. Sparks is not only calmly ignoring the President's telegrams, but has declared in writing to the commission appointed by Mr. Roosevelt that he will not convene the Legislature to consider the situation in Goldfield, or the raising of a proper State military force to police that place if it really needs policing. Gov. Sparks has only himself to blame if the world at large believes that he has been playing fast and loose with the Federal authorities and suspects that the call for troops was but an effort of the mine owners to utilize them in their own interest, as against that of the striking miners.

The refusal of the States of Washington and California to allow their militia to participate in next year's coast-defence manœuvres is of particular interest at this time, when every effort is being made to bind the National Guard and the regular army closer together. In this State we have one coast artillery militia regiment, and its enrolment, larger than that of any other in the State, is pointed to by those who assert that an alliance between State and Federal troops means renewed interest in the former. Indeed, it is currently reported that there will shortly be a move to change two more infantry regiments into coast artillery. To us this undertaking seems of little value. Good militia regiments of infantry and cavalry can be made, but not good technical troops. The adjutants-general of Washington and California are quite right in saying that, if the Federal government needs a reserve of this kind, it had better create one itself. The idea that troops could drill in an armory for six months in the year and in a fort for one week and then be of value in time of war is untenable. And where could the technically trained officers, skilled in electricity, in ballistics, in submarine mines, in gunnery, in all the intricate details of modern coast defence, be found to command such regiments?

Protests by the Italian government against the destruction by Kentucky "night-riders" of some tobacco owned by the Italian government tobacco monopoly, and against ill-treatment of Italian laborers in Louisiana, Florida, and Mississippi, bear out what we have said in regard to the necessity of a change of front in the South, if it would really attract foreign immigration. This the Charleston *News and Courier* admits in a recent editorial. The killing of two Macedonian laborers near Chathamsville, La., can, of course, be paralle'ed by the attacks on Chinese in the West; yet that in no way mitigates the horror of the crime, nor the shame it brings upon Louisiana and the whole country. There must be law and order if these States are to be fit habitations for natives as well as foreigners, and are to progress industrially. But when the Italian government officially declares that it has found many Italian laborers in a state of peonage "worse than slavery," the South must not be surprised if Europe looks upon it as decades behind the times. If the South is compelled by this attitude of the outside world to set its house in order, the colored man, too, may be relieved from those oppressive laws which, as Assistant Attorney-General Russell has officially reported, are drawn as though with the purpose of making a peon of him.

Prohibition in this country means to day a system of regulating the liquor traffic whereby whiskey may be obtained legally from the drug-store on a physician's prescription, and from the express office without any such prescription. The express companies, we believe, never maintain bars of their own, or permit drinking on the premises. Thus they offer the same discouragements to public drunkenness as did the now defunct South Carolina dispensary. But, good or bad, this traffic in original packages of intoxicants from other States is not authorized by the "dry" States. There is no partisan division on the question whether the Federal government should use its power over interstate commerce, to help rather than hinder the States in carrying out their own policies. Last week it was Tillman, a Democrat, who brought up the issue in the Senate. A couple of years ago it was Dolliver, a Republican. The question is one about which license communities have always been indifferent, but every growth of no-license sentiment increases its practical importance.

The year which has seen the removal of the motto "In God We Trust" from our coins, sees also the first official recognition of Santa Claus by the Federal government. Those thousands of childish letters, droll, quaint, or pathetic, addressed to the fabulous old gentleman at the North Pole, or Fairyland, or—as a good proportion are reported to be marked this year—"care of Theodore Roosevelt, Washington, D. C.," are to reach some one who may really give them attention. Hitherto, a soulless bureaucracy has stamped them "party unknown" and dumped them by bushels into the hoppers of the dead-letter office; but now unofficial organizations "of standing" will have the felicity of filling the orders for drums and guns, Teddy bears, and stick candy. It is said that the letters will even be answered. Mr. Pinchot, the Chief Forester, has also scouted the current belief that Christmas-tree cutting is a serious waste of our forests. So the trees may be enjoyed without the guilty feeling that it is at the expense of the future timber supply and the regular flow of the rivers. Acts like these show that the season of good will can make even a severe government relax.

The active bidding for hearth-fronts and columns of heavy stone at the auction of Stanford White's collections showed that there is a demand for sculpture, in connection with architecture, which the sculptors here do not satisfy. That we have capable sculptors is known to every one who has seen the exhibitions of the National Sculpture Society and such smaller exhibits of sculpture as appear in connection with other shows. Nevertheless, the attention of the public has been concentrated for a long time on painting, and glass windows and mosaics; and, as regards sculpture in stone or wood, there is noticeable apathy. Yet we have never had so many excellent workmen in the field of small statuary as to-day; and architects are doing their share to encourage sculpture on the exterior of city buildings, and also something toward a wider taste for sculptured hearths in country houses. One great difficulty which our sculptors encounter is that New York does not contain a suitable place for exhibition of the art. The winter show of statuary which was planned by the National Sculpture Society is going to Baltimore, where the armory of the Fifth Regiment, a fireproof building, will be used. We, too, have armories which would perfectly meet the requirements of a combined exhibit of architecture, sculpture, and flowers, but the right to use them for such purposes has been withdrawn.

An increase of 29 per cent. in population in eight years should be a fair, though not indubitable, proof of a country's material well-being. That increase is what the just completed Cuban census shows. From 1,572,845 in 1899 the number of inhabitants has risen to 2,025,282—a respectable population, as small nations go nowadays. It is only 400,000 less than Denmark's population, 200,000 less than Norway's, and over one-half

of that of all Central America. The increase, moreover, has shown no tendency to concentration, but has been marked in the entire island. The province of Havana, as a matter of fact, shows the smallest ratio of growth, 22 per cent. It is still the leading province, with a population of 517,524; but it is closely pressed by Santa Clara, with 457,897, and an increase of 29 per cent., and Oriente (formerly Santiago de Cuba), with 453,732, and an increase of 38 per cent. The highest rate of growth was in Matanzas, which now has 289,866, an increase of 43 per cent. Pinar del Rio's growth to 240,781 has been at the rate of 39 per cent., and Camaguey to 117,432 at the rate of 23 per cent. To these results immigration has, of course, largely contributed.

Of the four new cardinals created in the recent consistory, two are Frenchmen—the Archbishops of Rheims and Marseilles—and a third, to judge from his name, De Lai, is probably of the same nationality. A sudden increase in the number of French cardinals from five to eight is not without significance at a time when the question of the final disposition of church property resulting from the Separation Law is being taken up by the French Chamber. Of a repeal of the Separation Law there can be, of course, little hope. The problem that confronts the Church in France is one of organization for carrying on work under new conditions. That the head of the Catholic Church is in close sympathy with the faithful in face of their afflictions and the great task now before them, the increase in the number of French cardinals is probably one method of testifying. The devolution of church property is comparatively an unimportant matter in the eyes of the militant Catholic leaders; at most, it would be a question of saving a little more or less out of a general shipwreck. Organization for the future is the watchword—organization not only for defence, but for offence. We find such a fighting platform put forth, for instance, by the Bishop of Beauvais, some time ago. According to his statement, Catholics must organize, in the first place, to procure for the clergy the actual means of subsistence, as well as for the "reconquest" of religious liberty, for the defence of society against dissolution through the decline of morality, and for the protection of the young. "And the best mode of defence is to attack, so as to forestall further assaults. Napoleon was defeated only when he had ceased to attack."

The *Revue de Paris* publishes a translation of one of Mrs. Edith Wharton's novels, under the title, "Chez les heureux du monde," which, an inspired reader might guess, is French for "The House of Mirth." Translations from the English are enjoying increasing popularity in Continental periodicals, and especially as *feuilletons* in the daily press. In the case of such serious journals as the Paris *Temps* or the *Giornale d'Italia* of Rome, the suggestion is unescapable that the "puritan" literature of Great Britain, and to a less extent, America, is naturally adaptable. That the Paris *Figaro* should announce a translation of one of Robert Hichens's stories, may be explained by the element of the exotic which characterizes the Englishman's tales of North Africa—a field, by the way, in which French romancers have themselves done excellent work. It is notable that the favorites for *feuilleton* consumption are not the Hardys and the Merediths, but Kipling and Conan Doyle.

Bourgeois as a term of reproach has entered into the thought and speech of at least two generations. It rivals Philistine as a convenient epithet for what we do not like. In literature, in art, most of all in morals, to be a bourgeois is to be something indefinably but unspeakably awful. Careful parents and anxious teachers warn the young against incurring this taint. The malediction came to us from France, and there are those who maintain that we give it a more malign significance than it has in its country of origin. Prof. Barrett Wendell has recently pointed out that the great body of students at the French universities are bourgeois. So are the leading professional men; they derive from middle-class families in the provinces. Such is notoriously the case with public men in France. When the Socialist orator Jaurès flung the taunt of bourgeois at the Ministry, Clemenceau eagerly accepted it as if it were a badge of honor. As well reproach a Tammany statesman for being "close to the people"! These confusions have lately been the subject of analysis by a Frenchman, M. Aynard, Deputy from Lyons. In a speech before a commercial club, he took up the question of "the war of classes." It is, of course, "guerre à la bourgeoisie" that the Socialists declare, but M. Aynard defied them to say exactly what they mean. With as much truth as wit, he contended that "the term bourgeois is something much easier to resent than to define." There is no sure outward sign, nor infallible inner trait, by which one may detect the bourgeois. To be sure, there are great classes of people who may roughly be so grouped. But even in the class there is no fixity. M. Aynard had made a little investigation of a thousand of the most flourishing commercial houses of Lyons. Nine-tenths of them had been founded by men who were actual workmen or employees shortly before, and who with their families could not even be called bourgeois to-day, so rapid has been their rise, owing to their own initiative and force, with the free opportunity offered by the laws. There is, admittedly, in France as in this country, a kingdom of the bourgeois, but its boundaries are vague and shifting. Within it are the classes which represent stability, with rather banal ideas, no doubt, but which also represent energy, aspiration, and the spirit of progress. Hence, no sooner have the superior beings outside got their lorgnettes superciliously levelled at the bourgeois, than he suddenly makes his way up to where they stand, and pushes them aside. And presently he, in his turn, becomes very contemptuous of all that is bourgeois!

The career of Lord Kelvin illustrates the great opportunity and appeal which modern science makes to capable and aspiring natures. There is the element of intense mental satisfaction. To be grappling with the problems that underlie all human problems must yield its daily thrill. But this higher type of scientist never loses himself in unrealities. His sense of the actual is too strong for that. Hence he is always eager to show the bearing of his most refined speculations upon the thoughts and lives of men and the march of progress. And if, as an aside from his more arduous labors of the intellect, he is able to devise or perfect some process or tool to bring the triumphs of science home to the hearts of men, he has the contentment which comes from feeling his feet upon the earth and doing service to its denizens. His example shows what is really meant when we speak of the romance of science. De Maistre has a striking passage on the contrast between the scientific spirit of the present and the conception of science in primitive times. Then there was something almost supernatural in the idea of science; it brought up a mystic figure, "looking only at the sky, and with a foot disdainfully touching the earth only to quit it." To-day, on the contrary, science is pictured as loaded down with books and instruments, "pale with vigils and labors, and pressing forward panting on the path towards the truth, with eyes fixed ever on the ground." Yet the two conceptions are not wholly irreconcilable. In Lord Kelvin they were blended, and our point is that something of the old awe felt for the Magi reasserts itself in the case of such a scientist as he. He was seen to be one "commercing with the skies." Yet he would emerge from his closet, and display a kind of magic control over the forces of nature. Thus both reverence and gratitude attended him. The peculiar impress he made upon his time, such satisfactions of attainment as were his, could scarcely be paralleled in any other calling.

TAFT AND M'KINLEY.

Secretary Taft must find on his return home that his backers have been troubled about many things. Thus far their hopes and predictions have failed of fulfilment. The expected orders have issued from the White House, but have not proved self-executing. The obedient Southern postmasters have come forward as men ready to vote for Roosevelt, but strangely unwilling to be delivered to any man whom Roosevelt might name. Not in New England, or in New York, New Jersey, Pennsylvania, Indiana, or Illinois, has any real Taft sentiment been discovered; while even in Ohio there is a bitter contest for the delegates, with the practical certainty that Foraker will get at least a few. Such an outlook for the Ohio candidate of 1907 contrasts sharply with that of the Ohio candidate of 1895 when Hanna was in charge.

If one compares the management of the McKinley campaign by Mark Hanna with that of the Taft campaign by Arthur Vorys, the first effect is almost ludicrous. Whatever has to be said of Mr. Hanna, he was a man of undoubted grasp and energy. He knew how to make large political combinations. Force and bigness were the characteristics of his plans. Hanna was a strong man pulling along a weak candidate. Taft's manager, on the contrary, has made the impression of an ineffectual little gentleman clinging to the coat-tails of the big Secretary. His methods have been petty and waspish. The mailing of a million postal cards, from Columbus, with "Taft is a Sure Winner," or some such powerful effort of the imagination, printed on them, is a good measure of his political resource. Then, too, Mr. Vorys has spent too much time making denials and uttering charges and running to the White House with angry tales of treachery. It may not be fair to put all the blame of the Taft disappointments upon him, but much of it undoubtedly belongs there, and if a scapegoat is desired, there stands Vorys ready to be sent back into the Ohio wilderness.

Those who speak comfortable things to themselves about the prospects of the Taft campaign, ought not to forget how much brighter was the McKinley outlook at the corresponding period twelve years ago. Hanna was striking at the great voting strength of the Republican party. New England was practically conceded to Reed, though Connecticut in the end gave seven votes in the convention to McKinley; but in the other States to which the Republicans must look for electoral votes, the movement for the Ohio man soon became irresistible. Illinois, Indiana, with Minnesota and Michigan, were made sure for McKinley. Ohio was, of course, for him without a quaver or a break. Two great States, New York and Pennsylvania, were held by their bosses, Platt and Quay, but the McKinley tactics steadily undermined them. Before the convention, Quay threw up his hands, and, though Platt stuck to his "blind" candidacy of Gov. Morton, the "skilful agents of McKinley," whom the *Tribune* reported on December 2, 1895, to be at work in this State, labored to such good advantage that McKinley actually got seventeen of the seventy-two votes on the first ballot. The McKinley campaign, in a word, was one of the most shrewdly planned and triumphantly executed that the country ever saw.

The rather melancholy contrast which the Taft campaign offers is not wholly to the Secretary's discredit. It is not worse to have a timid and feeble manager than to be controlled by one who is powerful, but sinister and unscrupulous. Nobody is financing, or will be tempted to finance, the Taft campaign, as Hanna saw to it that the McKinley campaign was financed. Without money, Hanna could not work at all. His first instinct, whenever he wanted anything, was, as one of his Ohio intimates has phrased it, to "go out and buy somebody." The scandal of the lavish use of money to promote McKinley's nomination grew so great and open that Speaker Reed deliberately placed on record his opinion that delegates were bought like cattle. Secretary Taft might well prefer to fail rather than succeed by such means.

His friends say that they expect very positive action from him, as soon as he finds out the exact posture of affairs. What he could do, however, to put a new face on his campaign, does not appear. A change of managers may accomplish some good, but a radical change of spirit is what is needed. To-day, the Secretary inevitably stands as a patronized and second-hand candidate. The President intimated to the reporters last week that Cortelyou's declaration left "only one candidate in the field who can be regarded as representing the policies of the Administration, and only one Cabinet candidate." This means Taft, of course. That large-built, vigorous, and independent man is thus held up to the country as merely the shadow of another. This is what most kills off enthusiasm for Taft. And he, by not only assenting to the condescending endorsement of Roosevelt, but glorying in it, has made himself largely responsible for what followed. It may be that his speedy retirement from the Cabinet would now mend matters; but short of that, or some other clear demonstration to the country that he is his own master, we do not know what "positive action" he can take that will much avail. Indeed, the latest report from Washington is that the good-natured man is going to let others do the worrying about the Presidency.

THE REPORT OF THE BANKERS' COMMITTEE.

When it had become evident, from the run on the New York trust companies, that the State law regulating these institutions was dangerously defective, Gov. Hughes requested six bankers to suggest reforms. As long ago as October, 1901, the Clearing House Association had called attention to the fact that a number of trust companies were doing a deposit banking business pure and simple, with no requirement as to cash reserves, and with a latitude as to investment of demand deposits, which had not been deemed safe, and had not therefore been permitted, for deposit banks. In February, 1903, the Clearing House required of such companies as "cleared" their checks through banks the maintenance of a 10 to 15 per cent. cash reserve against deposits. In January, 1905, the State Superintendent of Banking somewhat timidly urged the passage of a law requiring cash reserves, and in April, 1906, the Legislature decreed that trust companies must maintain against all deposits a 15 per cent. reserve, one-third at least in cash on hand, and the rest, if a company chose, in the form of public securities and deposits with other institutions. This requirement, as events of last October have proved, is entirely inadequate: First, because this reserve is insufficient support for demand deposits; second, because no restriction beyond the slight limitations fixed by the old trust company law is applied to the use of such deposits. And the public's unanimous recognition of the part played by these two considerations in the disastrous panic led to the demand for new banking legislation and to the Governor's appointment of the committee.

Their report, a document of great value, does not confine itself to imperfections of the trust company law, but takes up comprehensively the abuses which the experience of last October brought to light. It recommends that the Banking Superintendent have power to veto the establishment of new banks, new trust companies, or new branches of either—that power to be a safeguard against the exploiting of such institutions by designing promoters, or their establishment in localities where they are not needed. The Superintendent should, in the committee's judgment, have a similar right to block the purchase of one banking institution by another. Both these recommendations are excellent; they are merely a new assertion of the duty of the State, which charters and shelters such institutions, to see that the powers thus granted are not used to defraud the depositor. The further recommendations that all loans must be submitted to the board of directors; that additional capital be required when branch banks are establish-

ed; that the proportion of loans to be granted to one borrower, or to one underwriting syndicate, be rigidly restricted; and that the Banking Superintendent administer the affairs of insolvent institutions as the Comptroller of the Currency does with national banks—each of these proposed amendments is both wise and necessary.

We regret, however, that the committee has not grappled more successfully with the overshadowing problem of restrictions, as to reserve and scope of investment, on trust company demand deposits. Three members of the committee advise a compulsory 25 per cent. reserve on all trust-company deposits in the larger cities, 15 per cent. to be cash on hand and 10 per cent. deposit credits in institutions approved by the Banking Superintendent; companies in smaller localities to keep 15 per cent. The two trust company presidents on the committee—both representing institutions doing an old-fashioned trustee business—disapprove the requirement of more than 15 per cent., holding that this, with the investment of their capital and the guarantee fund required by law, should be sufficient. A. S. Frissell of the Fifth Avenue Bank alone touches on the important question of separating trust deposits, subject to notice of withdrawal, from demand deposits subject to instantaneous recall. Against demand deposits in trust companies of New York city he advises exaction of the full 25 per cent. cash on hand which is required of deposit banks.

Mr. Frissell is, we think, right, for the reason that the pure deposit business of a trust company ought to stand on exactly the footing of the deposits of ordinary banks. If State and national banks in New York city need, as a safeguard to depositors, a cash reserve in hand of 25 per cent., similar business, conducted under the roof of a trust company, needs the same. It is true that the State imposes on the trust companies requirements as to investment of capital and accumulation of a guarantee fund in the hands of the State, requirements to which deposit banks are not subjected. But these provisions were applied with a view to the simple trustee business. No reform, we are convinced, will settle the problem of trust companies, partly or wholly engaged in ordinary banking business, unless it strikes at the root, compels a distinction between the two branches of the business, sets up the rule by which deposit accounts shall be allotted to the one department or the other, and applies to the banking department the full requirements of ordinary deposit banks.

CHANGES IN PERSIA.

The silent struggle which has been in progress for nearly a year between Persia's new Parliament and her new Shah gives signs of developing into open conflict. Our news from Teheran has been meagre and spasmodic; yet that in itself is a tribute to the peaceful way in which a revolution is being worked out by the second greatest Mohammedan nation in the world. Then, too, the tradition of the inhuman cruelty of the typical Oriental despot is shattered by the fact that neither the ruler who granted Persia's Constitution nor his successor who has repeatedly promised to obey it, should have resorted to violent measures.

The revolutionary movement received its impulse from the same cause that has set other Asiatic peoples into ferment—the Russo-Japanese war. Behind that, however, was a long history of misgovernment and social oppression of a peculiarly iniquitous kind. The reign of Muzzafer-ed-din, the late Shah, which began in 1896, was a period of unwonted extravagance. He squandered the treasure accumulated by his father, and entered on a series of borrowings from Russia which resulted in the establishment of that Power as the paramount influence at Teheran. The inhabitants of the provinces were subjected to the extortion of unscrupulous governors, whose relations to the court were still characterized by the free and easy responsibility of the ancient satraps. The important governorships were the recognized plunder of the various royal princes. The sale by the governor of Khorassan of five hundred young boys and girls as slaves in satisfaction of taxes imposed on their parents, was one of the powerful specific causes of the popular upheaval in northern Persia. The *khans*, or large land-owners, practised their own system of robbery, which consisted in illegally manipulating the water supply so as to deprive the peasants of the necessary irrigation facilities and compel them to sell their land at a ruinous price.

Not the least anomalous feature of present conditions is that the clergy should have been the leaders of popular agitation. Behind them, undoubtedly, was British influence. In July, 1906, occurred the dramatic secession of 16,000 citizens of Teheran who established themselves within the grounds of the British legation, while their leaders, the principal *mollahs*, or priests, took refuge in the sacred city of Kum. On August 5 Muzzafer-ed-din promised the convocation of a national assembly, which met in Teheran early in October and set to work upon a code of fundamental laws. The Shah signified his adherence to the Constitution on the death of his father in January of the present year; repeated his promise on February 10, when rumors of reactionary intrigues had aroused popular apprehension; signed the instrument on October 11, and took formal oath to it before Parliament on November 12 last. The reform movement has swept over the court and the provinces. Notoriously incompetent governors have been recalled, pensions and exorbitant salaries have been abolished, and Parliament has decreed the establishment of a national bank, founded on capital raised solely within the country, to which the entire administration of the state finances should be delegated. Foreign loans are absolutely prohibited.

That reform should have triumphed so completely proves, on the one hand, the utter unsoundness of the autocratic régime, and, on the other, a power of intelligent organization in the Persian people which we were loath to concede to an Asiatic race until after the battle of Mukden. Had the Shah had an army behind him, he might have held out against the aggressions of Parliament; but the soldiers have not been paid for two years. As for the clergy, they constitute over three-fourths of the National Assembly of 156 members. Having against him the two great factors which, in Russia, for instance, have proved the salvation of the throne—the church and the army—there is little wonder that the Shah should have found himself so helpless. On the other hand, the reform party has revealed an astonishing capacity for organization. Secret societies, pledged to the defence of the Constitution, flourish. There are seventy in Teheran alone, and it is a further remarkable feature of this debonair Persian revolution that, although these societies have been organized on the model of the secret associations which have played such a sanguinary part in the conflicts between Tartars and Armenians in Russian Transcaucasia, their course has been one of exemplary self-restraint, marred by a single incident—the assassination on August 31 of the Atabeg Azam, a notorious official whom the Shah had recalled from Europe and made Prime Minister.

Just now, there is dissatisfaction with a Parliament that has sat for fourteen months and achieved, like every first Parliament, little practical result. The national bank scheme has made no progress, because patriotism has as yet failed to supply the $30,000,000 fixed as its capital. In the provinces the people have been roused to a state of rebellion by rumors of reactionary cabals in the capital and by impatience with the work of Parliament, while governors of the old type and disgruntled royal princes have been dabbling in intrigue. Most important of all, perhaps, is the changed attitude on the part of the higher clergy. The two leading *mollahs* have been suspected for some time of carrying on negotiations with the court. They have been estranged from the revolutionary movement by such radical action, for instance, as the establishment, in the Constitution, of all other religions on an equal basis with Islam.

The announced intention of the British and Russian governments to intervene for the peaceful settlement of the points at issue between the Crown and Parliament is, on the whole, a favorable omen. Great Britain can hardly be expected to abandon the Persian Liberal movement. Russia will probably advocate the cause of her good friend the Shah. The result may be a compromise, by which the Parliament will be restricted to its legitimate functions, the Shah placated, and real "constructive" work begun. That the nation would rise in arms against an arrangement supported by the two tutelary Powers is improbable; and constitutionalism, which arose largely as a protest against foreign influence, may come to owe its secure establishment to that very cause.

THE NOVEL OF LARGE CANVAS.

Although a successful publisher is on record as saying that the man who could predict the fate of even one new book in ten would be practically beyond price, prophets continually appear to tell us what the next literary "tendency" is to be. The latest prognostication is that "large canvases" are to come again into fashion. Our novelists, instead of simplifying and unifying motives and reducing the number of their characters, will give their imaginations play, supplying minor characters and subplots as freely as may be. It is obviously unnecessary to enumerate the famous exemplars of the kind of fiction which seeks to make itself the mirror of many-sided contemporary life. It is as true that nearly all the novels ranked as "great" are constructed on this plan, as that nearly all of the dullest ever written follow it likewise.

As a matter of fact, so far have some of our leading and most popular fiction writers departed from this accepted model that the fabrication of a romance of only one character and no setting at all would seem the quintessence of success. Of course, it is not for mortals to carry their literary distillation quite so far as that, but it is easy to name recent novels, like "The Helpmate" or "Confessions of a Wife," which have practically but two characters, with only such background as is necessary to prove that these are not disembodied spirits. From the chronicle of their complex mutual reactions—they are usually in these days husband and wife suffering from incompatibility of temper—all extraneous matter is pruned with a ruthlessness which the old teachers of rhetoric would have applied only to the short story. Searching analysis, vital portraiture of character may be there in abundance, as well as a popular appeal to which the record of sales testifies, but a whole year's output of these books lumped together does not make a human comedy.

Some persons have been unkind enough to say that our novels are inadequately manned for the same reason as our coastwise fortifications—because we don't know how to raise the full complement. The writers of to-day, they say, could not, if they tried, invent such various and curious and interesting figures as raise their heads in every chapter of Dickens or Balzac. With only so many separate fictitious personages in his mind an author cannot afford to set one of these to opening gates or waiting on table or sitting about as bookkeeper or maiden aunt. Consequently, these minor parts are eliminated entirely, if possible, or if not, are filled by puppets without personality. The modern novelist—we are again quoting his hostile critics—is a past master of the art of suppressing characters who really ought to be in his stories, suppressing them because he has no flesh and bones to spare for them.

We should prefer to explain the condition in some way less humiliating than the confession that fancy is dead. Consider further analogies between the book and the drama. Our recent few-charactered novels are in many ways like the plays of our day. Some of them, indeed, might be dramatized without the elimination of a single character. But this is not all. It has always been an accepted principle that the reader of a book could be trusted to do far more in carrying plot and action along than the auditor at the theatre. Thus the convention is that the dramatist may let one character deceive another character, but never the spectator. That personage, being none too clever to begin with, and having no chance to turn back to the previous chapter, or shut his eyes to think things over, would be in danger of losing the thread entirely. The novel-reader used to be trusted more than that. If an extraneous episode, a battle description, an historical disquisition, or a tale told by a character was put in between two chapters, the reader was expected to get through it without forgetting everything that had happened before. It was assumed that he could tell the difference between important and unimportant characters, and that he would not, like a small boy on an errand, be distracted by any amusing occurrence at the corner. Thus, long after it was conceded by everybody that the playgoer was only a degree or two above the standard of admission to the idiot asylum, the novel-reader was still conceded a small element of common sense. Cannot a good many recent tendencies in popular fiction be explained on the assumption that its makers have come to regard their public as the makers of plays have long regarded their public?

The assumption that the "psychological" novel necessarily calls for any special qualities in the reader is behind much nonsense that is uttered on this point. As often as not, this type of novel is merely a device for letting the author talk about his characters, telling us how clever, or how deep, or how complex they are, as the case may be, instead of making them reveal themselves under the light of his genius. In that case it demands less continuous attention, loses less by skipping, and yields less to really thoughtful perusal than almost any other form of literature. Hence it is properly a compliment to English-speaking readers that bookmen are wondering whether, after all, they might not be interested in something a little more complex. We do not mean to say that the loss of the three-decker was altogether a calamity. Scott himself would doubtless blue-pencil a new edition of his works. But the breaking-down of the curious tradition that swashbuckling, homely rural, or divorce-court fiction, must alike be constructed on plots as elementary as equilateral triangles is encouraging.

NEW SHAPES OF DISEASE.

The interval which always separates the purely intellectual acceptance of a scientific discovery and its real incorporation into the thought of daily life, seems to have been longer than usual in the case of those discoveries which have to do with the transmission of disease. They are immensely valuable, of course. Health authorities apply the new principles successfully in times of threatened epidemics, and laymen know, when they stop to think, what precautions will reduce the likelihood of catching, say, typhoid or pneumonia. Some few sensitively-minded persons do try to reckon continuously and consistently with their bacillus-swarming environment. But no such prophylactic measures have yet become instinctive, like those by which we protect ourselves against even some petty inconveniences. Efforts are being made just now in many parts of the world to rouse the people to righteous wrath against certain of the creatures which science has shown to be persistent carriers of disease. This is a test of how far the new theories have really "sunk in." The task is not merely to fill people with an exterminating rage against some particular four-footed or six-footed species, it is to supplant the whole outfit of prejudices which make us constitutionally less afraid of the bringers of microbes than of more material adversaries not one-tenth as deadly.

One who would estimate accurately the difficulty of the task should make his researches, not in medical annals, but in those of art and letters. We are not speaking now of the belief in pestilence as a divine chastisement, though that has held mankind for ages. Disease has been variously incarnated by the imagination, but always as a figure of terri-

ble dignity. It was the Wandering Jew who carried the cholera. A cloud passed over the great city, and from it an awful hand was stretched forth to scatter the seeds of destruction.

> The angel of Death spread his wings on the blast,
> And breathed in the face of the foe as he passed,
> And the form of the sleeper waxed deadly and chill,
> And the heart but once heaved, and forever grew still.

Poe's story of "The Masque of the Red Death" is one of the best specimens of an extensive literature from which generations of readers have unconsciously gained an idea of the semblance of disease:

> The figure was tall and gaunt, and shrouded from head to foot in the habiliments of the grave. . . . His vesture was dabbled in *blood*—and his broad brow, with all the features of the face, was besprinked with the scarlet horror. . . . A throng of the revellers at once thew themselves into the black apartment, and seizing the mummer, whose tall figure stood erect and motionless within the shadow of the ebony clock, gasped in unutterable horror at finding the grave cerements and corpse-like mask which they handled with so violent a rudeness, untenanted by any tangible form.

For conceptions like these, fascinating and chastening despite all their horror, science substitutes what? The figures of rats and mice and such small deer.

In India, where over five million persons are believed to have died of the plague since 1896, the transmission of that disease is traced through the rat and the flea to man, and the authorities are planning a slaughter of the rats, in spite of the serious obstacle of the natives' belief that their departed ancestors inhabit those very creatures. In London, a rat-crusade has already been begun, and has the support of such men as Lord Avebury and Sir Harry Johnston. Here in New York a committee of the Merchants' Association has reported that certain diseases in the city regularly increase and decrease with the number of flies in the air, and is insistent that the fly question be recognized for what it is, one of the most serious that confronts any community. The mosquito, of course, has long been proscribed, and important societies, as well as public agencies, are warring against him.

It happens to be true that all of these disease-bearing creatures were already unpopular on other grounds. Germs or no germs, nobody liked rats or mice or flies or mosquitoes. So far as the average man was concerned, a cockroach on the table's rim, a yellow cockroach was to him, and it was nothing more. But that was quite enough to doom the pestiferous insect. On the other hand, if the scientists had found that the butterfly, and not the house fly, was a common carrier of the typhoid bacillus, that the park-dwelling, peanut-fed gray squirrel, and not the rat, disseminated diphtheria, and that the chickadee brought influenza in his beak, we can imagine that their tasks would have been much harder. Possibly some philosophers may be profound enough to find the reason for the very fortunate circumstance that the already unpopular vermin are the ones which in strict justice deserve capital punishment. Perhaps it is merely that the species which have become domesticated to the point of running about through our household arrangements are the only ones which have the chance to carry much infection, and at the same time are the only ones which bother us enough to make us hate them. Perhaps, as some biologists think, our antipathy to vermin is an instinct developed by long warfare. The race that tolerated vermin contracted disease and died off, while the people who fought them survived.

Indubitably, the next few decades will see some remarkable work along the lines here discussed. The house-fly, to find a use for which believers that everything is good in the best of possible worlds have to invent fables about sentries being waked up by impudent flies just in time to repel attacks, has had his day. A little care on the part of a large number of persons would make him a comparatively rare insect. And if to-day the predictions of a ratless, mouseless, flyless world seem fantastic, the sanitarians have in the past fulfilled prophecies which seemed at the time quite as staggering.

JAMES THOMSON ("B. V.").

I.

Twenty years ago, when I chanced upon "The City of Dreadful Night," and for some time after that, I enjoyed the flattering sense of proprietorship in Thomson which comes with discovery. He was in fact almost unknown then, outside of England, where he had his few but enthusiastic admirers, and it has been a matter of curious interest, not without a spark of pardonable jealousy, to observe the slow dissemination of his fame. Popular, indeed, he can never be, but the recent publication of a German monograph on his life and works* shows at least to what extent he has been accepted as a significant member of the literature of the nineteenth century. Such dubious honor at the hands of the *Seminar*, one feels, might have been spared the memory of a poet to whom life itself was a long indignity. And that life had already been told by H. S. Salt well and sympathetically.

*"James Thomson der Jüngere, sein Leben und seine Werke." Dargestellt von Josefine Weissel. Wiener Beiträge zur englischen Philologie, xxiv.—Like the earlier Wiener Beiträge, so far as I am familiar with them, this study possesses some value as a compendious statement of facts, but is otherwise a hodgepodge of stale pedantries. It sometimes seems as if to the German university mind the whole intellectual world between Kant and the Card Catalogue, between metaphysics and mechanism, is non-existent. The inconsiderate printing of doctoral and other perfunctory theses in Germany, and also in America, has grown to be a menace to sound learning. If they have any virtue, it is in dragging into the light of day the absurd theory that original production is the right discipline and the only test of scholarship. And now Thomson has received his crown of thorns at the court of the *Seminar*.

James Thomson—he signed his writings "B. V.," *i. e.*, Bysshe Vanolis, to avoid the name of the older poet and to mark his reverence for Shelley and Novalis—was born at Port Glasgow, November 23, 1834. When he was six years old his father, who was a sailor, came back from a distant voyage a helpless paralytic, living in this state until 1853. The family moved to East London, and from there, at the age of eight, James was admitted to the Royal Caledonian Asylum. At this time his mother died. She was, he says, "mystically inclined with Edward Irving," and "had also a cloud of melancholy overhanging her." Superstition, disease, poverty, and, one suspects, intemperance, must have made the child's home scarcely more desirable than the Asylum. All these dreary things it is necessary to take into account when we pass judgment on Thomson's habits and works. He was, as he says, an "Ishmael in the desert" from his childhood.

From the Caledonian he passed to the Royal Military Asylum at Chelsea, where he studied for a schoolmastership in the army. His first position was that of assistant teacher at the garrison of Ballincollig, about five miles from Cork. Here he came under the care of a kind and intelligent garrison-master, Joseph Barnes, who, with his wife, made a second home for the brilliant young assistant. Here, too, he became acquainted with Charles Bradlaugh, the radical politician and atheist, then a soldier of the regiment, who remained his friend for more than twenty-three years, and who was a strong influence for good and evil in the poet's future life. Perhaps even more important than this acquaintance was his meeting with a fair and frail young girl of fourteen, named Matilda Weller, who was likened by Mrs. Barnes to Eva St. Clair, in "Uncle Tom's Cabin," a creature of "undulating and aerial grace, such as one might dream of for some mythic and allegorical being. . . . Always dressed in white, she seemed to move like a shadow through all sorts of places without contracting spot or stain." Though but little more than a child at the time—like Hardenberg's Sophie—she was betrothed to Thomson when, after a year and a half at Ballincollig, he returned to the Chelsea Normal School; in another six months he received the news of her death. Years afterward he sent six sonnets, not intended for publication, to Mr. and Mrs. Barnes, and in one of them alluded to this bitter bereavement:

> Indeed you set me in a happy place,
> Dear for itself and dearer much for you,
> And dearest still for one life-crowning grace—
> Dearest, though infinitely saddest, too:
> For there my own Good Angel took my hand,
> And filled my soul with glory of her eyes,
> And led me through the love-lit Faërie Land
> Which joins our common world to Paradise.
> How soon, how soon, God called her from my side,
> Back to her own celestial sphere of day!
> And ever since she ceased to be my Guide,
> I reel and stumble on life's solemn way:
> Ah, ever since her eyes withdrew their light,
> I wander lost in blackest stormy night.

II.

It is customary, I do not know just why, to sneer rather skeptically at these ideal loves, these Lauras and Beatrices, of the poets, as if they were all as imaginary as the mad Don's Dulcinea. And yet, in the case of such a life as Thomson's, I should suppose it natural that the one gleam of

perfect youthful happiness might in the first years of bustling ambition be forgotten, and then, when disappointment and despair thickened upon him, should return always at more frequent intervals, and with brighter radiance, gathering to itself all the light of broken hopes and wasted capabilities How often in the nights of troubled sleep and feverish insomnia, for from this evil he suffered terribly, must the memory of that joy have flashed upon him with an intensity as keen as the vision of food to the starving castaway. There was no home with wife and children, for which he longed always with passionate regret, to mitigate his loss, no full and absorbing career.

For a while indeed he was busy enough. After leaving the Chelsea School the second time, being then scarcely twenty years of age, he was enlisted as army schoolmaster, and served at a number of posts, "pumping muddy information into unretentive sieves." In 1862 he was implicated in an offence against camp discipline, and was discharged because he would not give up the name of the actual culprit. He now came to London, where he got a clerkship in a solicitor's office, and began also to write for the magazines. For some time he lodged with Bradlaugh, then engaged in the affairs of the Secular party, and in editing its political organ. His association with that uncompromising radical and free-thinker was, as I have said, a doubtful benefit. It gave him, to be sure, a means of reaching the public when the more regular magazines were closed against him, and for ten or twelve years he contributed to the *National Reformer* his best work, including "The City of Dreadful Night," which appeared in four consecutive issues. That periodical and *Cope's Tobacco Plant* were his chief source of income when his clerkship was given up. But I cannot help feeling that the atmosphere of universal dissent injured the finer qualities of his peculiar mind; above all men he needed the rich, sustaining influence of tradition and human brotherhood to soften the asperity of his individual lot. It is true commonly in poetry as in religion: *multum contrariatur supernæ visitationi falsa libertas animi.* Who can say how much the narrowness of his appeal and the sharp contraction of bis pessimism are due to the fostering egotism of this false liberty of mind?

But friends came to him gradually, and even a measure of fame. He corresponded with W. M. Rossetti; while George Eliot, George Meredith, the Brownings, and other choice spirits recognized his genius and wrote to him in language of encouraging flattery. Various engagements were opened to him. In 1872 he was sent to this country by a mining company, and for seven months he stayed among the Rocky Mountains, sending home letters of graphic description and humorous comment. The next year he went to Spain as special correspondent of the New York *World;* but as he contributed only three letters in two months that connection was soon dissolved. His ruinous habit was already gaining on him, and year by year he became less trustworthy and less productive.

Everybody who has heard his name knows what that habit was. His taste for liquor seems to have been inherited, but did not show itself as a dangerous tendency until about 1855, when he was serving in the army. He was not a regular drinker; the thirst came upon him as a periodic disease, but with time the intervals of sobriety grew less and the lapses more terrible, so tbat his life might be compared with that of a Jekyll-Hyde, in which the demon slowly won the mastery. His last years were the tragedy of a great spirit hunted down and ashamed. There were kind friends who sought him for his brilliant conversation and magnanimity; he had always the more intimate friendship of books; but his life as a whole was, as he noted in his diary, "obscure, dismal, bewildered, and melancholy." The stanzas written on his forty-seventh birthday have the same note of final and irretrievable hopelessness as "The Nameless One" of Clarence Mangan. It is said tbat his last months were "a slow suicide, perceived and acquiesced in deliberately by himself." Death came to him in 1882, in his forty-eighth year, at the University Hospital.

III.

The literary product of such a life was not likely to be large, or its quality of a kind to attract many readers. In 1895 Bertram Dobell tried the public with a complete edition of his writings; he actually brought out his Poetical Works in two volumes (to supersede the three original issues of 1880, 1881, and 1884), and in the next year a single volume containing the "Biographical and Critical Studies"; but there was no encouragement to proceed with the edition. For the rest, tbe "Essays and Phantasies" of 1881 can still be bought, tbougb at a somewhat forbidding price, and there are two or three minor publications. It might seem that his prose at least should be popular. As a critic, he is shrewd and original, somewhat over-romantic in his taste, but always judicial in tone; the studies of Ben Jonson are particularly rich and variegated in interest. The miscellaneous essays show a surprising vein of humor and satire, with now and then a flaunting of gorgeous rhetoric which suggests a union of De Quincey and Poe. The probability is that his greater name as a poet of pessimism has deprived him of a good many readers who have been frightened away by that ugly word; in a very literal sense his reputation has become to him *nominis umbra.* And tbis is quite natural, for it is, after all, by his four pessimistic poems—"In the Room," "Insomnia," "The City of Dreadful Night," and "To Our Ladies of Death"—that he has taken a unique place in literature. Some, I dare say, would reckon "Vane's Story," or "Weddah and Om-El-Bonain," or one of his two Sunday idyls as more notable pieces of writing than "In the Room"; but there is something so singularly characteristic in this poem that it groups itself imperatively with the three acknowledged masterpieces. And in the grave and geometric simplicity of tbe stanzas; in the naïve complaints of mirror and table and curtain over their master, who, like another Chatterton, lies heedless of everything; in the slow heightening of wonder and mistrust until the old bed in "ponderous bass" speaks out the fatal word:

> "I know what is and what has been;
> Not anything to me comes strange,
> Who in so many years have seen
> And lived through every kind of change.
> I know when men are good or bad,
> When well or ill," he slowly said;
> "When sad or glad, when sane or mad,
> And when they sleep alive or dead."
>
> At this last word of solemn lore
> A tremor circled through the gloom,
> As if a crash upon the floor
> Had jarred and shaken all the room:
> For nearly all the listening things
> Were old and worn, and knew what curse
> Of violent change death often brings,
> From good to bad, from bad to worse:—

in all this tragic-comic inversion of life wherein the man alone acts the dumb part, there is a literary effect which we so commonly hear about, but so rarely feel—a veritable shudder of the nerves. How often must Thomson himself as he sat in his London lodgings, in that rigid tension, perhaps, which preluded a return of dipsomany, have prefigured to himself a day when he too might lie "unconscious of the deep disgrace."

IV.

After "In the Room" the natural transition and contrast is "Insomnia," with its burden of torture that impelled the poet night after night to rove the streets of London. The stanza, more complicated in structure than Tbomson generally employed, is handled with notable skill; the language is at once analytic and magnificent; here, as in the "Opium-Eater" of De Quincey, "the fierce chemistry of his dreams burns daily objects into insufferable splendor"; and yet withal the poem, owing to its over-wrought artificiality, or, it may be, to its too visibly pathologic basis, leaves one colder than any of its three companion pieces. Its chief value (thematically, not chronologically) is as a preparation for "The City of Dreadful Night," which is simply the impressions of an insomniac changed from self-complaining to a phantom evocation of the London as he came to know it from his fierce nocturnal vigils —"the City is of Night, but not of Sleep."

In the sharpness of its outlines, in the methodical balance of its members, there is something in this poem that borders on the geometry of delirium. The body of the work is composed of a series of brief cantos in a stanza of seven lines, which, for its perfect fitness to the theme, must be reckoned one of the few remarkable inventions of prosody. The idea of the stanza was taken, as Thomson himself admits, from that of Browning's "Guardian Angel" in the "Dramatic Lyrics," but the changes introduced by Thomson make it completely his own. Browning, to begin with, rhymed the seventh line with the first and third; by shifting this arrangement so as to rhyme together the second, fourth, and seventh, Thomson reduced eccentric formlessness to form, and gave to the three concluding lines the effect of a slow, melancholy refrain. A different use of the metrical pauses also, immediately felt by the reader but not easily described, adds a heavy, brooding quality to the rhythm quite foreign to Browning's impulsive temperament. Alternating with these descriptive cantos is a series of episodes, in which the narrative parts are in a common six-line stanza (a b a b c c), while the confessions, so to speak, of the *dramatis personæ* vary in metrical form according to their mood. The whole poem is like the phantasmagoria of a fever subdued to mathematical re-

straint, or the clamor of mad grief trained into remorseless logic. In the concluding vision of the "Melencolia" of Albert Dürer, seated aloof as queen of that people and symbol of their fate, the union of these qualities rises into the very enthusiasm and sublime of resignation:

. . . The sense that every struggle brings defeat
Because Fate holds no prize to crown success;
That all the oracles are dumb or cheat
Because they have no secret to express;
That none can pierce the vast black veil uncertain
Because there is no light beyond the curtain;
That all is vanity and nothingness.

Titanic from her high throne in the north,
That City's sombre Patroness and Queen,
In bronze sublimity she gazes forth
Over her capital of teen and threne,
Over the river with its isles and bridges,
The marsh and moorland, to the stern rock-ridges,
Confronting them with a coëval mien.

The moving moon and stars from east to west
Circle before her in the sea of air:
Shadows and gleams glide round her solemn rest.
Her subjects often gaze up to her there:
The strong to drink new strength of iron endurance,
The weak new terrors; all, renewed assurance
And confirmation of the old despair.

No one knew better than Thomson himself that this is not the city of all the world; indeed, the very sting of his grief is the feeling of isolation from the common lot. Few men tread those streets of denial and gloom habitually, but many have been there at one time of their lives and carry with them always, somewhere hidden from view, the badge of citizenship in that "sad Fraternity." To these, as well as to the few like-fated with the poet, his words will have a fateful meaning.

V.

The sequel to "The City of Dreadful Night" is the poem "To Our Ladies of Death," written in the same seven-line stanza. The only change is the substitution of a single for a double rhyme in the couplet, reducing the lyrical clangor of the rhythm to a more contemplative calm. The idea was suggested, as Thomson records, by "the sublime sisterhood of Our Ladies of Sorrow, in the 'Suspiria de Profundis' of De Quincey"; but for the three Sorrows we now have the three conceptions of Death —Our Lady of Beatitudes, the gracious mother, on whom the broken and hopeless dare not call; Our Lady of Annihilation, who awaits with her scourge "the selfish fatuous, proud, and pitiless; and, last, Our Lady of Oblivion, who gathers to her breast "the weak, the weary, and the desolate," and to whom the wanderer in the City of Night makes his plea:

Take me, and lull me into perfect sleep;
Down, down, far-hidden in thy duskiest cave;
While all the clamorous years above me sweep
Unheard, or, like the voice of seas that rave
On far-off coasts, but murmuring o'er my trance,
A dim vast monotone, that shall enhance
The restful rapture of the inviolate grave.

And so the cycle is made complete—from the sordid tragedy of the poet's room, through the terrible unforgetfulness of insomnia, to the conception of all life as a City of Night, and the despairing cry for the consummation of oblivion. Together the four poems present a rounded philosophy of pessimism, which stands quite alone in English literature, and which has, I believe, no precise equivalent in any language.

VI.

Pessimism is a word of many ambiguities, and needs defining. It is commonly applied to the Hindus, who in their better days were the least pessimistic of all peoples. To both Brahmin and Buddhist the representation of life as made up wholly of sorrow and mutability was but the foil to infinite exultant faith; the shadow of the earth was all black because the light of the spirit was so transcendentally pure.* That name might seem to belong more properly to the Greeks, whose philosophy of life, when it came to conscious expression, was summed up in the maxim of the plodding, common-place Theognis: "Not to be born is the best of all things for creatures of this world, nor to behold the beams of the bright sun; after birth the best is to pass as speedily as possible through the gates of death and to lie shrouded in much earth." Yet no one thinks of calling the Greeks pessimistic; their health was too bountiful, the impulse to live and enjoy was too strong. Pessimism is always individual, and not national, and comes when self-consciousness, unbalanced by spiritual insight, is developed at the expense of irrational instinct. The great exemplar of that inverted faith in antiquity was the Roman Lucretius—mad, perhaps by the administration of a love-potion, mad certainly at the thought of the human soul caught up into the dizzy whirl of atoms falling together into fortuitous worlds and again drifting into wild chaos:

For it seem'd
A void was made in Nature; all her bonds
Crack'd; and I saw the flaring atom-streams
And torrents of her myriad universe,
Ruining along the illimitable inane,
Fly on to clash together again, and make
Another and another frame of things
For ever; that was mine, my dream, I knew it.

That was the dream to which the science of his day had brought him, and it is the dream to which the purely scientific interpretation of life must then and always bring any mind that has developed to self-consciousness. It is, more particularly, the pessimism that lurks, unawakened or stunned by multifarious noise, in the background of our present eager civilization. In Lucretius that vision was accompanied with a passionate desire for the rest of perfect oblivion, and with a more passionate protest against a religion which would make the gods responsible for this jolting mechanism and capable also of prolonging man's life beyond the grave to be ground forever in these unresting wheels:

O genus infelix humanum, talia divis
Cum tribuit facta atque iras adiunxit acerbas!
Quantos tum gemitus ipsi tibi, quantaque nobis
Volnera, quas lacrimas peperere minoribu' nostris!

The successor to Lucretius in modern times is another Italian, Leopardi, in whose firmly-moulded periods and chastened passion something of the great form and spirit of the Romans seems to have survived. And the charge of Leopardi, if we omit the more personal tone of Christian times, is the same as that of Lucretius: bewilderment at the meaningless and unresting motion of all celestial and earthly things, with longing for the peace, if not the beatitude, of death.

VII.

It does not appear that Thomson was specially versed in Lucretius, whereas Leopardi was the acknowledged master to whom his "City of Dreadful Night" was dedicated; yet in some ways he is nearer in tone to the old Roman than to the modern Italian. More than one of Thomson's stanzas, with its bitter denial of a God who could spin for his pleasure all these follies of creation, or with its horror of a living eternity, rings like an echo of the *Tantum religio*. And there is the same *furor poeticus* in his vision of infinite motion. Read the first of his prose "Phantasies," in which the Shadow of Sorrow leads him at night into the thoroughfares of London:

The continuous thunders, swelling, subsiding, resurgent, the innumerable processions, confound and overwhelm my spirit, until as of old I cannot believe myself walking awake in a substantial city amongst real persons. . . . As my eyes fix and dilate into vision more entranced of the supreme and awful mystery, the browbrain upon my eyes expands and protends into a vast shadowy theatre for processions more multitudinous and solemn. The lamps withdraw and ascend, and become wayward meteors of the night; the night itself grows very dark, yet wherever I gaze I can discern, seeing by darkness as commonly we see by light; the houses recede and swell into black rock-walls and shapeless mounds of gloom; the long street is a broad road levelled forthright from world's end to world's end. All of human kind that have ever lived, with all that are now living and all that are being born into life, all the members of the æon of humanity, compose the solemn procession. . . .

This resolution of the seemingly stable world into an endless chain of spectral forms may be the vision of disease; its realism is no doubt the beginning of delirium; yet at bottom what is it more than the prospect of universal permutation that swam before the gaze of the ancient Epicurean? What is it more than the poetic imagination stung to frenzy by the scientific conception of universal motion? Or in what does it differ from the vast processions that thronged before the eye of Walt Whitman and that, but for his exuberant animalism, would have troubled our optimist with the same repulsion of fear? This is the ground which pessimism seeks always for its building.

Yet I would not imply that Thomson is in all respects akin to Lucretius, any more than I would equal him in renown to that mighty poet. The magnificent audacity is not here, the Roman courage to deny defeat, the supreme confidence in the human will to lay violent hold upon happiness if once the benumbing chains of superstition were broken. Nor must he be confounded with Leopardi. He lacks the intense patriotism which taught the Italian to sink his personal grievance against Fate in indignation over the long miseries of his people; above all, he lacks that deeper insight which once or twice lifts Leopardi out of pessimism into mystic self-surrender. There may be here and there something like acquiescence in his thought of resolution after death into the forces of creative Nature; but there is in all his works nothing that corresponds to Leopardi's brief and perfect rhapsody, "L'Infinito," with its haunting conclusion:

E il naufragar m' è dolce in questo mare.

One is never quite permitted to escape the narrower, personal outlook in Thomson, or

*Schopenhauer reproduced the darker side of Buddhism, but not the spiritual joy. He thus changed it to pessimism.

to forget that only his peculiar disabilities prevented him from concealing his philosophy in the common cares and sympathies of mankind. P. E. M.

Correspondence.

DE QUINCEY AND "THE STRANGER'S GRAVE."

To the Editor of The Nation:

Sir: The late Mortimer Collins, writing in *Belgravia* for October, 1870, has a reference to De Quincey, which has perhaps not received the attention it deserves.

Wetheral is on the banks of the glorious river Eden, the swift and sparkling stream which tradition declares King Arthur's father strove vainly to turn from its course, and on whose banks is the haunted hall where fairies in forgotten days left a mystic goblet with magical powers. De Quincey was there for a while and wrote a weird, wild story, "The Stranger's Grave," which is not to be found in his collected works.

Mortimer Collins was at Wetheral in 1858, and his statement no doubt reflects the local tradition, which is that Thomas De Quincey visited a brother resident at Wetheral and while there wrote the novel. Inquiries set on foot nine years ago did not yield anything more decisive. Mr. C. J. Longman, at my request, very obligingly examined the books of his firm, but without result. It is entered in the ledger anonymously and although various copies are recorded as having been sent to "the author," there is no name or address. An opportunity of reading the story occurred to me this year, and I give the result.

The Stranger's Grave. I could a tale unfold whose lightest word would harrow up thy soul.—Hamlet. London: Printed for Longman, Hurst, Rees, Orme, Brown and Green. Paternoster Row, 1823. 12°, pp. vii., 306.

The story is of a young man who, originally intended for the church, has changed to the army. Returning home after some service, he finds there Emily Gordon, a girl who, though his niece, is not a child, but a young woman of strong feeling. Some slight flirtation he has had with Sarah Franklin, but her image is effaced by the charms of Emily. In a boating excursion the boat is overturned, and, while Edward is rescuing Sarah, he sees Emily in danger. He saves her, but Sarah is drowned. This draws the two closer, and in the end he seduces her. Edward hears later from Emily that she is likely to be a mother, and is on the verge of suicide, when a brother soldier suggests that he run away with Emily to Spain and there marry her. The erring couple get clear from England, but in Spain he falls into poverty, and at the time of Emily's confinement is attacked by the jealous Spanish porters in whose work he has become a rival. In the scrimmage he knocks one of them into the water, is arrested, and sentenced to be flogged and placed in the stocks. When released, he finds Emily dead in bed, with a dead babe by her side. For a year he is a maniac. On regaining his reason, he is persuaded to return to England, and, on reaching his father's rectory, hears the bell tolling for the funeral of his mother, who had lost her reason through the incident of the elopement. Accompanied by his faithful dog, he goes to Wetheral, in Cumberland, and, dying there, leaves the rector a manuscript containing this story, and desires that on his tomb there may be only the words "The Stranger's Grave."

Such in mere outline is the story of "The Stranger's Grave." It does not suggest any strong characteristic of De Quincey's style; and, while not badly written, has no great distinction, but it must be remembered that narrative is not the form of literature in which De Quincey's most striking peculiarities would be apparent. Then, too, in a letter addressed to Hessey, undated, but apparently written in 1823, he refers to money received at the close of 1821 "for the novel." Can this be "The Stranger's Grave"? Was it transferred by Taylor & Hessey to Longmans for some business reason now unknown? If not "The Stranger's Grave," what was "the novel" for which De Quincey was paid at the end of 1821?

William E. A. Axon.

Southport, England, December 2.

ENGLISH AT THE INSTITUTE OF TECHNOLOGY.

To the Editor of The Nation:

Sir: May I venture to add to the discussion carried on in recent letters to the *Nation*, concerning college instruction in English, a word that may lend some aid and comfort to those who, like Miss Agnes P. Perkins of Wellesley (in a letter in the *Nation* of October 24), look for relief to a more reasonable examination at entrance to college, and to coöperation among the departments in college? In both respects the experience of the Institute of Technology is interesting and may be briefly related.

In examinations based upon the required list of books for reading and study we used frequently to find candidates deficient in particular information, but evidently capable of generally efficient English expression. Such candidates we accepted by a rather elastic application of the tests which the examination provided. Included in these tests was always one "composition" question in no way connected with the required books, aimed solely to discover the candidate's capacity for written expression. Excellence in the "composition" question was alone almost enough to secure acceptance; and evidence of some literary appreciation, even despite ignorance of particular books or authors, was held more acceptable than unappreciative literary learning. Schools which desired to were invited to submit any list of books preferable, in their opinion, to that of the committee on uniform requirements, and the Institute agreed to provide for any acceptable list an appropriate examination. A large Boston public school which sends many pupils to Technology had such special examinations for several years. In 1906 the requirement as phrased in the catalogue was readjusted to these conditions. On the new examinations the "composition" question was retained. The portion of the paper concerned with literature was not directed at any list of books. The Institute did not feel concerned to know what particular work a candidate had done in school or how well he had done it; such a test would properly be the purpose of the final examination in the school. The Institute examination looked forward and was concerned to determine whether or no the candidate had—by whatever training—attained a degree of mental cultivation which would enable him to perform the Institute work with profit. The committee's list of books was therefore declared no longer required, though presumably adequate for the development of such literary aptitude as we should expect. The literary part of the examinations has, in consequence, to be general; and the question is usually the requirement of comment—the character of which is more or less specified by the form of the question—upon an extract, printed on the examination paper, with which the candidate is assumed not to be previously acquainted. Though such a test seems vague, it has so far proved possible to prepare papers sufficiently exacting.

In the matter of coöperation the Institute is perhaps unusually fortunate. The ideal of the Institute is a combination of cultural and engineering training. It is neither a school for master mechanics nor a school only of graduate scientific study; *i. e.*, it neither ignores nor requires as prerequisite a liberal training, but aims to combine that with technical training. Probably on this account an unusual degree of cooperation has been possible in English work. In the first two years, during which English is a prescribed study, the department reaches all the students and is less dependent on coöperation; yet in both these years regular arrangement with the department of modern languages has provided for the criticism by English instructors of translations written for classes in French or German. Similarly, the English department provides exercises in note-taking to assist the student not only in his general but also in his scientific studies. In the last two years of the course, when English is no longer prescribed, the department is enabled still to continue training by criticism of written work prepared by students for other departments—including in recent years those of physics, architecture, electrical engineering, and mining engineering. The mining memoirs are abstracts and translations from technical magazine articles in French or German; the electrical reports, based on personal inspection of some plant, are such as an expert engineer would make in actual practice; and the papers from the department of physics are reports of original investigation and discussions of problems in physical science. In most cases the student reads and discusses his work with an English instructor, and may be required, for deficiency in English expression, to rewrite his work. I happen at the moment of writing to be at work on a sheet of rules for abbreviations and compound words, prepared with the help of the electrical department, for the use of such reports; and a professor of the English department is to have, from the time of the electrical engineering students, an hour to discuss the preparation of these reports. Besides these regular arrangements, covering the four years of the course, a special section is maintained by the English department, to which any student may be assigned by any instructor in any department, wherein written work is required, until he

shows that he has attained or recovered adequate capacity of written expression. Most commonly, of course, it is the English department that detects deficiency in an upper class man and requires of him work in this special section; but members of other departments may and do send to it students who in technical work show deficiency in English training.

Such coöperative arrangement is, of course, human, and works with some friction. There is difficulty in the mere matter of adjusting the hours of different departments. The English department is, too, almost absolutely dependent on the willingness of other departments to recognize the importance of such coöperation. It is an enormous help, however, that instructors in other departments should assume before their students that English is not a rather ornamental and very special department of erudition, but an indispensable tool of all business relations with men.

HENRY LATIMER SEAVER.

Massachusetts Institute of Technology, Boston, December 3.

THE ATTITUDE OF AMERICAN PRODUCERS.

TO THE EDITOR OF THE NATION:

SIR: The editorial article in the *Nation* of December 12 on "What Ails American Shipping?" is right—fundamentally right—in stating that the "deeper reason for our loss of prestige on the sea must be sought in the new mental attitude of the American people." This change in our mental attitude is to be seen in all directions of our industrial conditions; in the lessening efficiency of wage-earners, in the methods of our leaders of corporation finance, in the ambitions of the younger generation of Americans, as well as in the loss of our inventive power and of enterprise and courage in our shipping.

But is there not something behind this new "mental attitude"? What has produced it? Mental attitudes when on a national scale must proceed from some general cause, and paternalism can hardly serve as an adequate explanation. Japan and Germany have made extraordinary strides in industrial efficiency and in shipping, yet government assistance and supervision are far more extensive in those countries than in our own. There must always be some government regulation and assistance. Our choice apparently is not between government and no government, but between bad government and good government. Japan, which is making great headway in every direction of industrial enterprise, furnishes a notable example of what many critics might denounce as paternalism.

Is it not true that the *Nation's* editorial article is rather an indictment of our political efficiency, and particularly of our administrative capacity? Institutions make men, quite as much as men make institutions. At the beginning of the nineteenth century the United States had a Federal bank—a paternal institution—and yet our shipping was never more flourishing. Today, we are living under a most exaggerated protective system and a shipping law as antiquated as the feudal system. These are great handicaps, but they are hardly sufficient to account for a general decline in American shipping, and more particularly in American industry and inventiveness. My own impression is that the deeper cause is owing to the fact that the door of opportunity is closing to enterprise. The old fashioned virtues of thrift, perseverance and industry have no longer the reward that they once had. It is not so much the specific acts of the government that have brought about this change, as the inability of the government properly to administer the duties that belong to it. Sins of omission have done more injury than sins of commission. Even if certain laws were repealed there would not be left a fair field and no favor. The field has already been occupied and the government seems powerless to remove the intruders and to keep them within bounds.

Formerly our corporations and private industrial establishments, including employers and employees, had their minds mainly on the productive process. They were interested in the rewards of industry. At present, however, some of our most prominent captains of industry have their minds, not upon productive processes, but upon profits gained by combinations and manipulation. At least, the industrial element is a minor consideration. Unearned gains seem to be the greatest ambition of the ambitiously inclined. The result is a sort of hypnotic effect upon all classes of people. Industry and thrift are old-fashioned virtues more honored in the breach than in the observance. But our real enthusiasm is reserved for a more modern species of enterprise of which the most important item is restriction rather than increase of output. This attitude of mind toward the acquisition of wealth is probably the real cause of our diminishing industrial efficiency. The average man is looking for some speculative or unearned gain. He hopes for some lucky turn of the market in his favor by which he will be relieved of the burden of work. D.

Cambridge, Mass., December 19.

Notes.

The index for the current volume of the *Nation*, July-December, 1907, will be printed with the issue of January 2, 1907.

The C. M. Clark Publishing Company will soon have ready the first volume, "Theodosia: the First Gentlewoman of Her Time," of a ten-volume historical study of "The Great Triumvirate: Jefferson—Hamilton—Aaron Burr," by Charles Felton Pidgin.

Dr. G. W. Prothero is giving up the editorship of the *Quarterly* and will be succeeded by J. C. Bailey. The new editor is, like his predecessor, interested primarily in literature, and the *Quarterly* will no doubt maintain its high standard in that field.

The Hon. A S. G. Canning's "British Writers on Classic Lands" (New York: A. Wessels Co.) completely fails to meet the expectations aroused by its title. Here was an opening for a really useful book, from which the general reader might gather the main results of the travels and studies of such men as Rawlinson, Layard, Grote, Flinders Petrie, and Evans. Only the first two of these are so much as mentioned, and receive scant attention, while the reader is offered instead an incoherent discussion of Pope, Macaulay, Gladstone, Milton, Shakespeare, and, not least surprising, Dickens! Mr. Canning's real interest seems to lie in the history of the Jews, to whose peculiar destiny he constantly recurs. He devotes sixty pages, about one-fourth of the book, to a rambling discussion of Milton's description of the temptation of Christ, as though Milton's fine rhetoric about Rome and Athens justified one in calling him a writer on classic lands. The style of the book is loose to exasperation, and often ungrammatical, and there is no evidence whatever of sound scholarship. In the footnotes the reader is referred, for all classical allusions, to Lemprière. "Priam, The last king of Troy, Lemprière," or "Plutarch, A Greek of eminent virtue, Lemprière," are fair examples. Mr. Canning regularly writes Mecoenas for Mæcenas, the patron of Virgil and Horace.

"The South Americans: The Story of the South American Republics, their Characteristics, Progress and Tendencies, with Special Reference to their Commercial Relations with the United States," by Albert Hale (Indianapolis: The Bobbs-Merrill Co.), is a work that has many of the characteristics of a guide-book, and should have been entitled "A Guide-Book Through South America, with some Historical Notes for Travellers." As such, it will serve a useful purpose, and at the same time impress the idea that such travel is not accompanied by any serious hardship; in fact, in most cases is more agreeable than travel through the Southern States of our own country. As long as Mr. Hale confines himself to the details of travel his work is not only helpful, but interesting. Unfortunately, he felt called upon to enter the field of broad philosophical analysis. It is necessary to cite but one instance, in which the author endeavors to explain the moral difference between Latin-America and the United States. On page 6 he says:

> On one point our inheritance of revolt from the Roman Catholic Church has made us superior to them. We, as a people, have what we style a New England conscience, or what with more dignity should be called a moral sense; this is eminently self-sustaining in all our struggles for improvement and reform. A moral sense has never been more than feebly developed in South America, and where it makes itself felt it has become a force artistic or ethical rather than religious or moral.

To attempt thus to explain so complex a situation is to beg the question rather than to answer it. Then again, in his treatment of the Monroe Doctrine, the author advocates, pp. 351 and 352, a formulation of the Monroe Doctrine which would enable European countries to occupy South American territory, and would involve us in endless complications. These flights into philosophical generalization do not, however, diminish the value of the book as a safe guide to travel in Brazil, Uruguay, the Argentine, and Venezuela.

To the already long list of German writers on Iceland there has been added a new name with the publication of "Island in Vergangenheit und Gegenwart" (Leipzig: W. Engelmann. 2 vols.), by Paul Herrmann, professor in the gymnasium at Torgau, Prussia, and a well-known writer on Scandinavian and Germanic mythology. Professor Herrmann travelled in Iceland

in the summer of 1904 with the mission of the Prussian government. His book is comprehensive. The first volume contains chapters on physical geography, history, government, education, sanitary condition, industry, trade, farming, fisheries, and the dwellings, interspersed with the author's own experiences and observations in the capital and its neighborhood; the second volume is essentially an account of Professor Herrmann's travels in the country, starting from Reykjavik through the southern and eastern districts to Akureyri on the north coast, a route seldom taken by foreign travellers. But it is by no means an ordinary narrative of travel, it is full of information about the life of the people and natural phenomena, containing many references to the ancient and modern literature of Iceland, especially to the sagas. He is particular about his sources, shows good judgment, and writes in an easy and entertaining manner. As a whole, the book, which is adorned with many good photographs, is both readable and reliable. One cannot help regretting that there is not in English such a work, to which one might turn for trustworthy information about modern Iceland, in spite of the fact that books of travels in Iceland are more numerous in English than in any other language.

To the investigations of the literary problems in connection with the Pentateuch Prof. A. Klostermann, of the University of Kiel, contributes "Der Pentateuch, Beiträge zu seinem Verständnis und seiner Entstehungsgeschichte, Neue Folge" (Leipzig: A. Diechert, 583 pages, 10 marks). Klostermann has for nearly two decades made a specialty of the literary analysis of the Pentateuch; and, as appeared from his "Pentateuch," 1893, his attacks are directed chiefly against the current Wellhausen theories, although he cannot be for this reason regarded as a defender of the Mosaic authorship. In general his tendency is conservative. A special feature of his work of historical parallels to the evolution of the Pentateuchal codes; as, *e. g.*, between the Deuteronomic legislation and the Icelandic, and between the reformation under King Josiah and the rediscovery of the law books of Numa. In general, the strongest part of Klostermann's work is his handling of Deuteronomy.

Another work of conservative scholarship is the "Geschichte Israels bis auf Alexander den Grossen," by Prof. S. Oettli, of the University of Greifswald (Calw und Stuttgart: Vereinsbuchhandlung, 6 marks). This volume deals with the history of Israel's development on the basis of the current literary analysis of the sources. In a modified form Oettli advocates the Erlangen conception, particularly as voiced by Von Hofmann, author of "Weissagung und Erfüllung," according to which the Old Testament is substantially a history of redemption.

The house of A. Deichert of Leipzig announces as forthcoming early in the new year a commentary on John by Prof. Theodor Zahn of the University of Erlangen, leader among the conservative German students of New Testament literature and the history of the New Testament canon. In this Kommentar zum Neuen Testament the following volumes have appeared: Matthew, by Zahn; I and II. Thessalonians, by G. Wohlenberg; Ephesians, Colossians and Philemon, by Prof. P. Ewald; I. Corinthians, by Dr. Bachmann; Galatians, by Zahn; The Pastoral Epistles by Wohlenberg.

An interesting example of the manner in which modern research is contributing to Biblical investigation a mass of material hitherto scarcely regarded as sources for knowledge of the Bible is found in the new work of Dr. Oskar Dähnhardt, of which vol. I. has just been issued by the house of B. G. Teubner of Leipzig and Berlin, under the title, "Natursagen: Eine Sammlung naturdeutender Sagen, Märchen, Fabeln und Legenden"; and this present volume is specially devoted to "Sagen zum Alten Testament." The author, who, as is seen by such books as his "Naturgeschichtliche Volksmärchen" and "Deutsches Märchenbuch," is a veteran student of folklore; and in this publication, he has, with the assistance of a score or more of helpers, of whom fifteen are mentioned on the title page, ransacked the sayings and stories of all peoples for materials illustrative or explanatory of the Old Testament. As a rule he has merely placed the material clearly before his readers, leaving it to the latter to determine the value and worth of these data. The mass of detail, however, here collected is very striking, although the whole of the Old Testament could not be covered. He has dealt only with those portions in regard to which other nations have a more or less significant folklore, such as the creation of the world and of man, demonology, the Fall, the Deluge, fallen angels, and prominent characters, like Abraham, Joseph, Moses, and David. Three other volumes are to complete the work: Vol. II., entitled "Sagen zum Neuen Testament," promised within the next few months; and vols. III. and IV., "Tier-und Pfinzensagen." Still other volumes, "Sagen von Himmel und Erde," "Sagen vom Menschen," together with a critical examination of "Wesen, Werden und Wandern der Natursagen" are projected.

Giovanni Rosadi, advocate, deputy, critic, playwright, lover of all the arts, is surely one of the most versatile and genial figures in Europe to-day. His monograph on the "Trial of Jesus" made his Italian fame international. Now he comes forward with a book on criminology, under the Dantesque title "Tra la Perduta Gente" (Florence: Bemporad). When we say criminology, we do so for the sake of brevity only. Rosadi's book does not lack philosophy, and we can imagine its portraits of typical offenders against society being cited before grave congresses, but in the main the intention is literary. Like Hutchins Hapgood, and the late Josiah Flynt Willard, he is especially concerned to show us what manner of men these murderers, thieves, and forgers are, how they feel and think, what class morals they profess. Incidentally, if we are wise, we may speculate on how the lost folk should be treated. In a manner the book is a human reduction to the absurd of the old view of corrective or vindictive punishment. Signor Rosadi believes that we may hardly hope to reform or even deter the criminal as such. Hope lies rather in some form of universal moral education, the nature of which remains unhappily quite undefined. The studies are eloquent throughout, and only rarely is the author betrayed by the luridness of his theme into a rhetoric too exuberant for non-Latin readers. Orators, writers, æsthetes, philosophers, dilettanti, fugitives, elegists, are some of the titles of the chapters, and the text usually makes good the apparent paradox of the caption. The work is uneven, but at its best, as in that terrible chapter on the asylum for the criminal insane at Montelupo, admirable. Everywhere one feels the weakness of the existing penology. Italy, for example, has reaped much credit in certain quarters for abolishing the death penalty, but how shall we regard this boon to homicides, when Signor Rosadi assures us solemnly that every corpse that comes from an Italian prison to the dissecting table should be examined, as if the cause of death were suspicious. Taken broadly, these studies make against all unitary and merely physical theories of the cause of crime. They mark a reaction against the Italian school which regards the criminal as merely malformed. Signor Rosadi shows us how complicated, at times, how logical and inevitable, are the motives that lead to crime. The remedy, then, is not the segregation of or extinction of a bad physical type, but such moral training as shall reach all young people, and especially those neglected children from whom professional crime draws most of its recruits.

Prof. Theodor Aufrecht of Bonn, whose death was noticed in the *Nation* of April 25, p. 386, has left a library which is especially rich in works on Sanskrit and Indic philology. A rough catalogue of perhaps 2,200 numbers has been issued, and may be had of Prof. Hermann Jacobi, No. 59 Niebuhr-strasse, Bonn. While it is not advisable for a great library to buy such a collection as this *en bloc*, on account of the embarrassingly large number of duplicates, Aufrecht's books present for a small library an opportunity not lightly to be dismissed. Inquiries may be addressed to Prof. Charles R. Lanman of Harvard University.

The fifth report of the Committee of Management of the Advanced Historical Teaching Fund, University of London, notes that forty students attended the course, five of them graduates of American universities.

The progress of college libraries of the United States in fifty years is very striking. The subject is treated in the *Library Journal* by W. N. Carlton, librarian of Trinity College, who tells us that at the middle of the last century there were but two colleges in the United States, Harvard and Yale, which had 50,000 volumes. Such typical New England colleges as Amherst, Dartmouth, Colby, Middlebury, University of Vermont, Wesleyan, and Williams, had less than 7,500 each. The Columbia College library, the largest in New York, had 12,240; Hamilton, Colgate, and the New York University, had less than 5,000 each; Princeton had 9,000; the University of Pennsylvania 5,000; while seven other Pennsylvania colleges had an average of 2,839 each. Altogether, the 126 college libraries at that time in the United States possessed 586,917 volumes, 155,000 less than are now collected in the Harvard Library alone. Annual incomes for library purposes

were as pitiful as the book collections. For some of the leading colleges, the library incomes were as follows: Harvard, $450; Bowdoin, $200; Princeton, $400; Amherst, $300; Williams, $200; Union, $100; Columbia, $200. Only two college libraries had endowments, those of Yale and Brown, which were $27,000 and $25,000, respectively. Even more significant as showing the small esteem in which the library was held, are the rules for use by students. The following are typical: At Amherst the library was open to students but once a week, and no student was at liberty to take a book from the shelves without special permission. At Yale, freshmen and sophomores were entirely excluded.

Plans for the new State education building at Albany, to house the State Library and the Education Department, are now complete, and work on the foundation has already begun. Pictures and floor plans of the building, together with a brief description of its architectural features, will be published in the January number of *New York Libraries*. The building will have a length of 590 feet and an extreme depth of 285 feet. The first floor is to be occupied chiefly by offices of the Education Department, while the second and third floors are to be given up to the State Library and its various departments. The general reading room is 128 feet long by 107 feet wide, and in design is an adaptation of the Bibliothèque Nationale of Paris. The main stack, designed to accommodate 2,000,000 volumes, is seven stories high. Apart from the main stack, there will be auxiliary stacks for the special collections in law, medicine, legislative reference, and technology, having a capacity of 360,000 volumes. In addition to the stacks, there will be sufficient shelving to bring the total book capacity of the new building to 3,000,000 volumes. On the third floor sufficient space has been reserved for the library school to enable it to accommodate about twice the number of pupils it has hitherto been able to receive. The estimated cost of the building, when completed, is $4,000,000.

The Prix Goncourt, of 5,000 francs, has fallen this year to Émile Moselly (Émile Chénin in real life), a professor at Orleans, and author of "L'Aube fraternelle" and "Jean des brebis ou le livre de la misère."

Charles M. Skinner of the editorial staff of the Brooklyn *Eagle* died December 21. He was born in Victor, Ontario County, N. Y., in 1852. For twenty-two years he had been on the *Eagle*, part of the time as critic of music and art. In addition to his newspaper work, Mr. Skinner wrote a number of books concerning American folklore, in which he was especially interested. The titles of his works on this subject are "Myths and Legends of Our Own Land," "Myths and Legends Beyond Our Borders," "Myths and Legends of Our New Possessions," "American Myths and Legends." He was also author of several nature books, among them: "Nature in a City Yard," "With Feet to the Earth," "Do-Nothing Days," "Flowers in the Pave," "Little Gardens." Mr. Skinner wrote a play, "Villon, the Vagabond," and adapted Richepin's "Le Chemineau," both of which dramas were played by his brother, Otis Skinner.

Prof. Richard Boeckh, director of the Statistical Department of the city of Berlin and professor of statistics at the university, has just died at the age of eighty-three.

RECENT VERSE.

The Lotus of the Nile. By Arthur Wentworth Eaton. New York: Thomas Whittaker. $1.

In Grasmere Vale. By James A. Mackereth. London: David Nutt.

Gypsy Verses. By Helen Hay Whitney. New York: Duffield & Co. $1.25.

Youth. By J. H. Wallis. Boston: Richard G. Badger. $1.

Hathor. By Stanly Coghill. San Francisco: A. M. Robertson. $.75.

Selected Poems. By E. R. Taylor. San Francisco: A. M. Robertson. $2.

Through Painted Panes. By Louis Alexander Robertson. San Francisco: A. M. Robertson. $1.50.

Said the Rose and Other Lyrics. By George Henry Miles. New York: Longmans, Green & Co. $1 net.

Lincolnshire Rhymes. By Mabel Peacock. Louth: J. W. Goulding & Son.

The Fire Divine. By Richard Watson Gilder. New York: The Century Co. $1 net.

New Poems. By Stephen Phillips. New York: John Lane Co. $1.25 net.

Under the Laurel. By Frederic Crowninshield. New York: Dodd, Mead & Co. $1.50 net.

There are some tones that are less heard in poetry to-day than a generation ago. The note of recollection—the note of Wordsworth and "Tintern Abbey"—is less frequent. And so is the note of illusion, at its best one of the highest and purest in English poetry:

> We are such stuff
> As dreams are made on, and our little life
> Is rounded with a sleep.

You may search a dozen volumes of current verse and catch hardly an echo of them. Occasionally, as in Dr. Eaton's "Lotus of the Nile," you will find a poem or two composed in the old familiar meditative key:

> I never caught so clear the master note
> From old monastic centuries, days remote
> In thought and speech, most in religious mood,
> As when a lonely traveller I stood
> Amidst the ruins England loves so well,
> Her Fountains Abbey in the Vale of Skell.

Or perhaps in the case of one who has been drawn to Wordsworth or some of the elder poets particularly and has caught their tune unconsciously, the same note will recur, though less distinctly, as in Mr. Mackereth's "Grasmere Vale":

> Rest, Poet, in thy simple grave:
> The tangled hum of Sabbath bells
> Throbs round thee, and the winsome wave
> Comes from the genial fells.
>
> Pride folds the fallen dust of kings:
> Sleep, Poet, with the sons of toil,
> 'Mid sanctity of homely things,
> Sealed in God's scented soil.

Still more rarely the perception of human vanity and earthly insecurity makes itself heard again, but faint and changed, with a new undertone of bitterness and regret very different from the old serenity and restraint. Mrs. Whitney's "Gypsy Verses," for all their rollicking associations, are athrob with it. Low and subdued at times, again hauntingly reminiscent of Villon, as in the "Old Women" and "Dead Ladies," this sentiment of the final bankruptcy of sense and weariness of spirit breaks out shrill and penetrating and unmistakable in the sonnet on "Age":

> Blindness, and women sailing on white seas,
> Seas where no placid sails have ever been.
> Dreams like wan demons on waste marshes seen
> Through dulling fevered eyes. The dregs and lees
> Of wine long spilt to dead divinities.
> Gray, empty days when Spring is never green,
> Can the heart answer what these riddles mean—
> Can the life hold such hopelessness as these?
>
> Love lying low in the long pleasant grass,
> Youth with his eager face against the sun,
> They may not guess the hours when these shall pass,
>
> In what drear coin such lovely dreams are paid,
> At what grim cost their flowery days are won,
> When man is old and lonely and afraid.

For the rest there is confusion of voices. With a reluctance to accept the canons and conventions of the past, there is joined an inability to secure a perspective capable of harmonizing in one consistent vision the distracting seethe of modern ideas and aspirations with which the poets' minds are rife. Now and then, to be sure, some one succeeds in casting a kind of transitory and factitious glamour about these troubled and incongruous elements. At this kind of thing, Mr. Wallis is exceptionally clever in his volume "Youth." Cheerfully and even complacently acquiescent with the new ideals, a materialist apparently, a worshipper of strength and success, an admirer of what is big and red and loud, an echoer in some sort of Swinburne and Kipling, he knows how to turn his impressions to good account in a series of poems, of which these verses from his "New America" will give the keynote:

> What were the ancient great that blazed
> In colored pomp that flamed like the sun
> To this where liberty hath raised
> A hundred nations into one?
>
> How would their gods of battle class
> With thine? Thine iron ships would glide
> Through triremes as through broken glass,
> Thy guns would soil the phalanx' pride.
>
> The treasures that the Great King lost
> At Susa or Persepolis
> Were baubles to the giant cost
> That makes one city what it is.

These things make striking verse, no doubt, though they fail to read the riddle or hush the cry of perplexity or protest that rises occasionally from amid the general satisfaction and complacency.

It is another, more vexatious spirit which animates the lines of Stanly Coghill's "Hathor":

> Out of the depths I cry,
> Gods who fashioned me,
> Out of the earth and sky
> And rush and roar of the sea;
>
> Gods who fashioned me
> Where the waters flow and croon,
> What bitter jest filled the heart of ye
> As ye laughed 'neath the scornful moon?
>
> Say, was there never nigh
> A higher God than ye?
> Why did you work 'neath the midnight sky
> On the night ye fashioned me?

The writer of these remarkable lines, posthumously published unhappily, appears to have been, at least by residence, a member of that little band of San Francisco poets at whose head are Dr. Taylor and Mr. Robertson, both interesting versifiers, though

given rather over-much to reprinting. Surprisingly enough, though not unnaturally perhaps, they seem even more classical than the poets of the East. They affect the sonnet a good deal, particularly Dr. Taylor, who is fairly successful with this form. It is singular, too, how much of their inspiration is furnished by books and other literary and artistic themes. Their poetry shows reading, taste, cultivation. Indeed, Mr. Robertson's, who has evidently greater abundance of poetic gifts, shows something more. His "Ataxia," and, above all, his "Thunder Tune," are unusual poems in any comparison, and strike out occasionally a ringing and memorable line:

Hear the protest 'gainst the quick quietus, when
the demon whispered to the Dane,
And then listen to the larger logic of the fervent
phrases that contain
Such a creed, that Death's loud summons or his
faint procrastinated call,
Wakes no fear in those who face the darkness with
the words "The readiness is all."

After all, it is among these poets who live in some sense retired with the Muse that it is necessary to look for the most satisfactory verse to-day. They seldom have more than one string to their lyre, these minor poets, but that one is often singularly sweet and clear. They tend their own little plot of ground for their own pleasure, at times very negligently, no doubt; but along with the brambles they not infrequently succeed in raising one or two of those simple old-fashioned flowers whose charm seems for some reason or other to be perennial. Chief among such blossoms of the season is George Henry Miles's "Said the Rose," a poem of remarkable tenderness and pathos, and in its own subdued manner, of originality. The writer is dead now; and it profits little to notice the crudeness and imitativeness which disfigure a good deal of his work. But even the worst of it has a kind of distinction, such as comes to perfection in the "Rose," which makes it a matter of regret that he should so often have followed wandering fires, instead of striking out a plain, straight way of his own.

Even simpler in their inspiration are Miss Peacock's "Lincolnshire Rhymes." They are very unpretending pieces, most of them, remarkable mainly for their local attachment and homely associations, as well as for their astonishing success in retouching some of the oldest and most elementary of the poetic chords. In form, as in motive, many of them are ballads; and like the ballads, their effect is cumulative and grows with reading.

Decidedly more academic and "literary" is Mr. Gilder's "Fire Divine," though not without an occasional excursion into nature or public affairs. Of the latter sort is by far the liveliest piece in the volume, "The Whisperers," dated "New York, 1905":

In the House of State at Albany—in shadowy corridors and corners—the whisperers whispered together.

In sumptuous palaces in the great city men talked intently, with mouth to ear.

Year in and year out they whispered, and talked, and no one heard save those who listened close.

Now in the Hall of the City the whisperers again are whispering, the talkers are talking.

They who once conversed so quietly, secretly, with shrugs and winks and finger laid beside nose—what has happened to their throats?

For speak they never so low, their voices are as the voices of trumpets; whisper they never so close, their words are like alarm bells rung in the night.

On the whole, it is, perhaps, these rhythmic intermissions of Mr. Gilder's on one subject and another which give his book a kind of distinction or difference, lending it a bold, adventurous, innovating air, among the increasing legions of mildly meritorious versifiers, whose names have outgrown enumeration.

We may close with a comment on the paradoxical contrast in the work of two names already well-known. Stephen Phillips has for so many years devoted himself to the drama that we have almost forgotten his first lyrical successes, and so Mr. Crowninshield, though not unknown already as a poet, has made his position primarily as an artist. One would expect the dramatist to carry the problems of life into his songs, and the painter to transfer his vision of color and form into sensuous rhythm. But the contrary is true. Mr. Phillips does not eschew the pragmatic things of the present; he has his verses to "Gladstone" and "Dreyfus," he touches now and then on the tangle of the emotions; but it is not these poems that tempt us to linger over his pages. Like most of the lesser versifiers of the day, his virtue is in the sensuous, unthinking perception of beauty. We read him for his picture of Endymion:

Endymion, glistering from the morning stream,
In beautiful cold youth with virgin eyes,
Sprang naked up the Latmian steep, and stood
In the red sunrise shaking from his hair
The river-drops, and laughed, he knew not why;—

or for this image of the moon gliding down into the sleeper's arms:

Lo! like a lily vast the luminous Bloom
Unfolded slow upon the noon of night:
A moment, like a rain-drop at its edge,
Selene, brightly faltering, earthward slid;
And all the argent Flower had closed again.
Endymion heard his name amid the stars
Breathed; and again "Endymion!" he heard
Cried out in passion between earth and heaven;
Then "O Endymion!" stole into his ear.

Of this sensuous transfer of beauty from the eye to the ear, Mr. Crowninshield's volume carries but a little. Something approaching it may be felt in his artistic valuation of the fair model in his studio poems, or in his sympathy for New England scenery; but even here it is the drama of the model's inner life, or the human significance of the landscape that chiefly interests him—and us. He is not sure enough of his rhythms, and is somewhat too fond of unusual words to set the sensuous chords within us vibrating; but, as a seeker after the meaning of life, perplexed at times, often indignant, always courageous, he stands notably apart from the crowd. The series of sonnets that occupy the central part of his volume have a substratum of reflection that is the rarest quality in the verse of the day. We can quote only one, and that more personal than critical:

O starry Sagittarius, bright Sign
Whose high effulgence rayed upon my birth,
Remorseless thou hast brought me neither mirth,
Nor solace of good cheer, nor love of wine
Or wassail, nor the ease of wealth. But mine
Hath been the briered portion of the earth—
Travail and strain, and ceaseless care, and dearth
Of mindless sleep, kind Nature's anodyne.
Great starry Archer, what doth mean for me
Thy tense-drawn bow, thy quivering shaft of fire
Which gleams in dark-blue fields eternally?
That I should bend my bow in pain, nor tire
Of futile shafts? Futile? Oh, it may be
That one will pierce the mark ere I expire!

CURRENT FICTION.

Between the Dark and the Daylight. By W. D. Howells. New York: Harper & Bros.

This volume represents a characteristic mood of Mr. Howells's, though not always a fruitful one. The psychical experiences which lie "between the dark and the daylight," spiritualism, hypnotism, dreams, intuitions, transferences, and "telegraphies"—all these matters have long had a mild avocational interest for him. He does not precisely take them seriously; his attitude seems to be characterized rather by a good-humored receptiveness than anything else. He can hardly be imagined in a state of excitement over a spook of any species, mental, "spiritual," or material. But it pleases him to think that there are more things in heaven and earth than are for sale in the markets of Manhattan. He likes to potter among his collection of "psychical" curios as other amiable connoisseurs among their tulips or their china. Doubtless some of the trifles he brings forth between thumb and forefinger for our edification mean more to him than to us on account of their associations, the odd places and seasons of their picking-up. Few of the articles of *vertu* in this book are of much intrinsic value. In fact, the only one of these stories which has real dignity, expressing as it does something of Mr. Howells's full power, is the first and longest of them, entitled "A Sleep and a Forgetting." Here, in the simple, moving way which has marked (we mean distinguished and limited) his best studies of the feminine, he describes the temporary mischance of oblivion to which a sudden shock of grief has subjected a young American girl. Her mother has been killed before her eyes in an accident at a grade crossing. In consequence the girl has lost her power of remembering not only the fact of the accident itself, but the things which afterward happen to her day by day. The distracted father leaves his business and takes her abroad, in the hope that change of scene will in some way restore her to herself. At San Remo a young American doctor is thrown into momentary contact with them, and is appealed to by the father to do what he can for the daughter. The doctor tarries at San Remo, and, of course, he and the girl, in their diverse states of innocence, proceed to fall in love. The consequence is that the girl finds herself coming slowly out of her strange condition, and by dint of another shock is made complete mistress of her memory. It is all so much the kind of thing one likes to expect of Mr. Howells as to dwarf, somewhat disproportionately, no doubt, the tolerably good magazine tales which make up the rest of the volume.

Walled In. By Elizabeth Stuart Phelps. New York: Harper & Bros.

Again Mrs. Ward has taken a New England college town for her scene; and to any one who is familiar with the setting, her story will have a good deal of interest. If she were a young writer we might be tempted to say of her recent work that it has shown increased promise. It seems to contain more sentiment and less sentimentality, less appeal to the sensibilities of the schoolgirl and the shoplady, than

marked the "Confessions of a Wife," and (in less degree) its successors.

The specific problem is, we fancy, one of perennial concern to college communities. A studious and promising professor has married a vain, silly, and pretty woman. She has no interest in his work or ambitions, but is entirely absorbed in the enjoyment of such primitive pleasures as the undergraduate life provides. The professor's wife of this type is, we suppose, almost as well recognized in such an atmosphere as the "college widow." The pretty and indiscreet lady in question is, to be sure, an exaggeration of the type; for she is hard of heart as well as frivolous; as clearly predestined to hurt as to please; and her indiscretion is not limited to the ordinary philandering. She has already taken to her light ways before the professor, a fine figure of a man when she married him, is crippled by a motor accident. After the habit of her kind, she is repelled, not softened, by his disability. She neglects him more and more openly; and her affair with one of the undergraduates becomes less innocent. In the meantime, her step-sister, who is in every respect unlike her, has come upon the scene. She is professionally a nurse, and naturally and by training a woman of sensitiveness and generosity. The gay and silly wife half cynically, half contemptuously gives her husband into the care of this admirable and desirable creature; being herself freed to go her own primrose way. The husband, who is not a fool, in due season finds himself not only admiring but desiring the one person in whose presence he finds sympathy and rest. He half declares his feeling, asking nothing, and half understands that there is danger for her also in the continuance of their relation. At this point the silly wife is providentially drowned, in consequence, we are given to understand, of the horrid fact that she has gone canoeing with the less innocent undergraduate. The next thing that happens is what one wishes to happen—in a book; namely, the surviving pair, instead of allowing themselves to be happy in this release, are afflicted with qualms, wonder if they have done their full duty to the departed, wonder if it can be right for them to be glad that they are no longer uselessly tormented; and having arrived at this *impasse* of the "New England conscience," proceed to give themselves the still more useless torment of a speechless parting. If they had been guilty of the worst, these two people could not have been more chop-fallen over the kindness of fate.

But Mrs. Ward has told the truth: these things do actually happen (though less frequently, perhaps, than print would lead one to suspect) in New England. Fortunately, not even the New England conscience is powerful enough to conquer (in the long run) the New England common sense. That is why the Puritan ordinarily escaped being actually hoist with his own petard.

Lisheen. By Canon P. A. Sheehan. New York: Longmans, Green & Co.

A young Irish landlord makes the surprising discovery not unconnected with a reading of Tolstoy, that the condition of the Irish tenant is not all that it should be. He has half a notion to look into the matter for himself, but the inconveniences attendant upon such an inquiry are sufficiently plain to him. He has a feeling that the only way to get at the root of the matter would be to go down among the peasants and live their life. He continues to be vaguely eloquent upon the subject until a club bet rather unexpectedly commits him to the actual experiment. He becomes a laborer in a peasant family upon his own estates, is evicted with them, and, after some vicissitudes, both sociological and amatory, becomes a model landlord: not that he becomes a peasant on a large scale, and takes his tenantry altogether into his bosom. Canon Sheehan is content with a more old-fashioned, and, it must be said, more thoroughly tested model: "Slowly but surely a happy and thriving and industrious population grew up around the 'Great House': a population knitted in the firmest bonds of loyalty to those who were protecting and helping them."

This is all very well for a plot, but its handling is tame and ineffective. We are advised from time to time that the landlord is a fine fellow, one of the wisest and noblest of his kind; but we are not persuaded that he is anything more than a feeble and emotional manikin. In fact, the human figures in the story are all more or less shadowy or grotesque. Yet it contains fragments of dialogue which are extremely clever; as well as a good many passages of description and comment which, if not profoundly humorous, are pleasant because of their Hibernian good-nature and acuteness:

> It was the evil quarter-hour before dinner—the *pars gelida* before that daily holocaust of society, when the guests are frozen by first introductions or limited acquaintance; when the hostess is frozen by frightful anticipations of spoiled viands, kitchen catastrophes, yawning intervals between courses, and all the other dread possibilities of the dinner-table; when the waiters are frozen into frigid icicles of propriety and decorum; and probably the only warm person under the roof is the cook.

Alas that in the next sentence the second lady should be described as "A daughter of the gods, divinely fair"; and the villain (who leans against a marble mantelpiece and listens cynically) as "cold and slimy as a coiled snake!"

Folkungaträdet. I. Folke Filbyter; II. Bjälboarfvet. By Verner von Heidenstam. Stockholm: Bonnier.

When Verner von Heidenstam published his sketches from the times of Charles the Twelfth, entitled "Karolinerna," their kinship to Runeberg's "Fänrik Ståls Sägner" was at once commented upon, a kinship, however, more in the theme and in the similarity in types than in anything else. No such obvious comparison offers itself in the case of Heidenstam's latest work, "Folkungaträdet," of which the first two parts have so far been published. But one cannot help recalling that older series of historical romances from mediæval times in Sweden, C. G. Starbäck's "Engelbrekt Engelbrektsson," and "Guldhalsbandet." Starbäck was a trained historian, with great narrative talent, and he unfolded a pageant of types and events from one of the most interesting periods of Sweden's history, that country's first struggle to free itself from the "union" with Denmark. Heidenstam, a born poet, has produced something quite different. Though a large amount of antiquarian learning is shown all through the volumes, *e. g.*, in the scene where the old miner comes before the Earl of Bjälbo and his mother, the centre of interest lies in the individual characters. The nearly primeval figure of Folke Filbyter, the founder of the family, viking, peasant proprietor, and highway robber; Valdemar, the son of Birger of Bjälbo, a dreamer all his life, sensuous, irresponsible, never comprehending the responsibilities that rest on him as king; his brother Magnus, who eventually drives him from the throne in order to save the country—all these personages stand out before the reader as clearly as in actual life, clearer even, because interpreted by a poet's insight.

The True Patrick Henry. By George Morgan. 24 illustrations; pp. 492. Philadelphia: J. B. Lippincott Co. $2 net.

In preparing his entertaining volume, which is especially rich on the personal side, and in its presentation of Virginia and family tradition, Mr. Morgan has had the use of many original papers relating to Henry, which have come to light since the publication of Wirt's well-known biography. It is unfortunate that the supposedly popular nature of this series has seemed to require a treatment apparently designed to meet the approval of those who do little serious reading. Furthermore, it is not likely that an approach towards finality has been attained by the contributors to this "True" series, any more readily, because of the claim suggested by the title. The author of the tenth volume is favorably known as the writer of two novels, "John Littlejohn of J." and "The Issue," in which he disclosed a liking for the picturesque in American civilization, skill in portraying it, and unusual familiarity with several of the larger episodes of our national life. It was to be expected that in his Life of Patrick Henry the attractive qualities of his method would be once more conspicuous, for there was much in the career of the Virginia orator to lend itself to precisely the kind of appreciative treatment that Mr. Morgan is so well qualified to give. But there was also much to offer as serious obstacles to a sympathetic biographer. It is the chief defect of Mr. Morgan's book that he claims too much, in too many directions. What with sparring with Thomas Jefferson, William Wirt, the Virginian clergy, the civil authorities, and the upper classes of Virginia, and nearly everybody who thought lightly of his hero's powers, the author makes a brave, but not always successful, effort to change radically the critical estimate of Henry's professional and political services.

On the stage acting is an art. In political life it is apt to be the enacting of a more or less artistic falsehood. Patrick Henry was a great actor off the stage. His special rôle was the old one, played successfully by so many potentates of the past, of arraying the masses against the nobles. There are too many tributes, from opponents as well as friends, to the effectiveness of his art to make the absence of an adequate record of his words and arguments of supreme importance. But full appreciation of his art does not involve entire ap-

proval of the man behind the art. The gist of the celebrated Parsons case, from which Patrick Henry took his first leap into public reputation, is hardly to be found in the opposing claims of clergy and people, as stated by Mr. Morgan. At the bottom of the contest lay the simple truth that tobacco was a very inferior form of money, because of its liability to extreme fluctuations in value. But it was the one thing that nearly every Virginia colonist possessed, and it was therefore agreed by custom and law to use the product as the basis of a circulating medium. There was thus established a vicious money system, in whose harmful operations the clergymen of the Virginia branch of the Church of England eventually became entangled. The system once adopted, and contracts with the clergy having been made in accordance with it, the people soon sought to pay the clergy, not in the tobacco money to the amount called for by contract and law of their own devising, but in actual money of much less value. The tobacco crop had failed, and the price had risen. The greenbackers and the silver men of modern times had their prototypes among the Virginia colonists, whose advocate and hero Patrick Henry became. When the suit brought by one of the clergymen to recover his pay came to trial, the jury, which seems to have been made up of the poorer class of taxpayers, promptly gave a verdict in favor of the minister, but fixed the damages at one penny. In a highly civilized community or with groups of men of the higher types, among whom simple sincerity is one of the supreme tests of culture, there would seem to be little in this triumph of Henry, won by appealing to some of the least admirable instincts of primitive man, on which to base a sound public repute. But it was the beginning of Patrick Henry's fame; and since then in many corners of the country men have held a following and high station by the same familiar method.

Nor can it be successfully maintained that as a lawyer, bound by the ethics of his profession to do the best he could for his client, Henry was justified in pursuing the line of argument which he adopted. Legally he had not a peg on which to hang his case, and it would be easy to call a long roll of American lawyers of eminence who would have declined the conduct of a case without any legal basis, the successful prosecution of which depended upon an adroit appeal to the general disregard for the law and upon denunciation of clergy and Church. Admitting that Henry foresaw the overthrow of the power of England in her American colonies, and that he wished to further the movement more than he desired to promote his own fortunes, that was not the proper time, or the proper place, or the proper method to advance the cause of independence. The existing lawmaking power and the system of courts were necessary for the adjustment of contending interests and for the stability of society until other legal powers were established; but Henry sought with more or less success to involve the Church, the law, and the courts all in one general ruin. In a law court the revolutionist is out of place.

Indeed, we may say that as a lawyer Henry is, on the whole, best remembered for his efforts in behalf of error and injustice, as in this Parsons case and the suit which the Virginian Hook brought to recover the value of cattle taken for the use of the Continental troops. Hook, of course, was entitled to his money, but Henry, exerting all his dramatic art and skill, succeeded in defeating the ends of justice. His method was the same in the Randolph murder case and the Harvey case. In what was perhaps his most important civil case, that of Jones vs. Walker, in which Henry represented the defendant in an action to recover the amount of a bond given before the Revolution, his present biographer says that the orator scored a triumph. But again he was on the side of injustice, and the Supreme Court finally decided in favor of the plaintiff, so that it is difficult to see on what substantial ground a triumph can be claimed.

As a soldier Henry's record was brief and inglorious. He retired to private life because the civil authorities had little confidence in his military ability and because on his side he was only willing to serve in supreme command in his State. There were such men in the civil war, Hooker and McClernand among others. The Grants, Meades, and Thomases, Johnstons and Lees, in the face of humiliation went on performing their duty and serving their cause, trusting to time and event to do them justice.

In spite of his limitations and his actual failures Patrick Henry's services to the cause of independence were great enough to make unnecessary that form of apotheosis which would attribute to him the virtues and achievements of other men. It was in the interval beginning with the breaking down of the old order and ending with the establishment of the new; when as a member of the House of Burgesses he opposed the Stamp tax and stirred the emotions of Americans, that his legitimate and most valuable work was done. Edmund Randolph's keen analysis of Henry's ability and shortcomings, which appears to be borne out by the evidence, was as follows:

> In pure reasoning he encountered many successful competitors; in the wisdom of books many superiors; but though he might be inconclusive he was never frivolous, and arguments which at first seemed strange, were afterwards discovered to be select of their kind, because adapted to some peculiarity in his audience.

On the other hand, towards the end of Patrick Henry's public career, when he vehemently opposed the adoption of the Federal Constitution, he set himself apart from the men of his time of the first rank. He feared that a consolidated government would "destroy the States and swallow the liberties of the people." He seems not to have perceived the infinite number of opportunities for practical revolution to be found in popular elections or to have understood that if eventually the liberties of the people are to be swallowed up by a "consolidated" government, the change will be due to so great an unfitness of the people for popular government that no precautions on paper could forever guard against it. "Your President," said Henry, "may easily become King." But the President who becomes King will have been preceded by Presidents who can only have broken the way to a kingdom by the consent of an ignorant and indifferent populace.

If Herbert Spencer was right in his thought that the American government will fail in some great crisis because of the unfitness of the masses to consider serlously a complicated question, the public men most needed in the United States are not leaders like Patrick Henry, who will seek to strengthen their own power by urging the populace to insist that legislatures, congresses, and officials respond immediately to some demand of the hour, but statesmen who will seek to give back to legislatures and to Congress that check upon public opinion which the constitutions of the nation and the States intended. As it is to-day, legislatures tend to become a register of last week's popular impulses; the national House of Representatives mostly records the wish of the President. To some extent Henry's fears have been realized. The Senate remains as a check upon public impulse; but already there is a widespread movement for the popular election of Senators. It is a truism, of course, that the national Constitution did not contemplate the present day notion that what the masses want at the moment must necessarily be good for them. The course of safety lies in the Constitution, which Patrick Henry opposed; in the maintenance of the powers of the State in that path which was so carefully marked out by the framers of the Constitution of 1787, and which lies half way between that excess of Federal power in the President on the one side which Patrick Henry feared, and on the other side excessive obedience to the whims of the people of which obedience Patrick Henry's career was mostly an advocacy.

The Soul Market. By Olive Christian Malvery. New York: McClure, Phillips & Co. $1.50.

This book owes a charm to its nondescript character. It is not fiction, or autobiography, or sociological report, but savors somewhat of all three. There is a quality very warm and human and engaging in this casual narrative. Miss Malvery was of Anglo-Indian birth, and came to London as a young girl for musical training. Chance led to the discovery of her real gift, and she became a reader instead of a singer. Her public recitations won a popular success, and she acquired a good deal of vogue as an entertainer at private parties. Her professional experiences among "the best people" seem to have set her thinking. She discovered that her fashionable patrons were often unscrupulous, and usually unintelligent:

> The real patrons of music and art in England are the people. Society is not really musical at all. If it were, there would not be so many starving musicians scattered about. The very rich are seldom truly artistic or musical, though there is a fashion among them of posing as patrons of music and art. What society runs after is the latest sensation. It rarely ever encourages unknown talent.

Miss Malvery's ensuing experiments as street singer and barrel-organist, confirmed her suspicion that the real lovers of music are among the poor. Her interest was aroused in other aspects of the life of the lower working classes of London. Under various disguises and in various capacities she tasted the bitterness of the ordinary wage-earner's lot; really tasted, not merely sniffed at it after the manner of

the "slummer" and the lady journalist. For months at a time she lived the life of the streets, the shops, the factories, and the lodging-houses. Her motive sprang from personal interest and sympathy rather than from the tabulating zeal of the professional sociological investigator; and her book is a series of random notes upon certain episodes in an extraordinarily varied experience among the London poor. From it all she emerged neither disheartened nor in imagined possession of a panacea.

The two chief causes to which she attributes the destitution of the slum family are interesting. The women and the children are, her observation teaches, ground between an upper and a nether millstone: the idle and drunken man of the family, and the slave-driving alien. She has little faith in the cry of "no labor," which still goes up from mobs of stalwart men in London streets:

> Men who ought to be supporting healthy and happy families by legitimate work spend 95 per cent. of their earnings in the public house—that is, if they are earning at all, as for the most part the husbands of women engaged in home employment are irredeemable loafers.
>
> And these women are as a rule condemned to toil, with the aid of little children, under the lash of foreign-born taskmasters, who have been freely admitted to over-crowded London, bringing with them the hard thrift and insatiable cupidity bred of their native squalor.
>
> I was much struck during the descents I made into Poverty Kingdom, to find in how many cases the distress, overwork, and evilly bad pay were due to the trades worked in being monopolized by foreigners. And then again the utter misery caused by the over-crowding, insanitary condition of the houses, inability to claim a sufficient water supply, and all the ugly results of desperate over-population in certain districts, were due almost entirely to the fact that the property in those neighborhoods had been, bit by bit, acquired by our alien friends.

Miss Malvery's experiments are by no means without parallel in these days. But they seem to have been inspired and carried out in a spirit of ingenuous devotion rare in any time; and the record has a quality (which one may call emotional if he will) sharply differentiating it from reports coldly rendered by the student in sociology or stories jauntily got up by the enterprising journalist.

Science.

History of Astronomy. By Walter W. Bryant. New York: E. P. Dutton & Co. $3 net.

In the first half of this book Mr. Bryant, an official of the British Royal Observatory, writes purely as an historian, but in the second half, dealing with modern times, there is a large measure of his own opinions on pending questions. This gives life to the book; but there is something else that almost withdraws the gift—a frequent effort to dispel the gloom of a somewhat recondite subject by attempts at humor, and elephantine gambolling with anecdote. Only that supreme devotion to duty which animates all reviewers enabled us to continue beyond p. 222, where is mentioned the German Dr. Witt's discovery of an important minor planet. Since this is the only planet so far discovered by him, Mr. Bryant recalls a suggestion that it "be named *Brevitas*, as being the sole (discovery) of Witt."

The book contains a few inaccuracies, such as a confusion of the Smithsonian and Carnegie Institutions of Washington, on p. 134. Occasionally, too, there is a lack of lucidity in style, and a use of cryptic expressions or unexplained technical terms. But in general the author's opinions are clearly expressed and are also sound. We mention two points that are especially creditable. On p. 194 he ascribes the important discovery of terrestrial latitude variation correctly to Kustner of Berlin, whereas, both in England and America, it is usually and incorrectly credited to Chandler. Even the last (1906) Annual Report of the Smithsonian Institution contains an article by Abbot, on "Recent Progress in Astronomy," where this error is repeated. It is due no doubt to Chandler's having discussed the question extensively in a long series of memoirs a very few years after the discovery itself had been announced by Küstner. The other opinion (p. 215) that seems to us both correct and timely relates to the "canals" of Mars. It is worth quoting:

> In fact, so far as the argument depends on terrestrial and human analogy the assumptions involved are so great that Professor Lowell's very plausible explanation can hardly be called convincing. . . . Admitting his evidence, his deductions as to intelligent beings on Mars, who can not only construct thousands of miles, in fact hundreds of thousands of miles, of great canals at least a mile wide, but can also force water to fill them against its natural inclination, are scarcely, if at all, credible. . . . It is well known that a trained observer, who knows by experience exactly what he is looking for, will see with comparative ease what an average person entirely fails to distinguish; but it is also beyond question that observers of supposed trustworthiness have recorded things as seen which have had no real existence, but which they expected to see. In other words, personal bias counts for something, and whether the observation be made by the man who believes or by one of his staff who is told what to expect, it will be regarded with skepticism by the man who does not believe.

In the rich collection of manuscripts which Frau Elizabeth Campe, daughter of the well-known publisher, B. G. Hoffmann, has willed to the City Library of Hamburg, a number of unpublished letters of Voltaire have been discovered. They constitute a part of Voltaire's correspondence with the philosopher and mathematician S'Gravesand of Leyden. In 1731 Voltaire visited S'Gravesand for the purpose of consulting him with reference to the discoveries of Newton, of which S'Gravesand was the pioneer advocate in the Netherlands. As a result of this conference we have this present correspondence, full of interesting data with reference to the spread of Newton's views; and these letters are soon to be published.

Dr. Berthold Laufer of the department of anthropology at Columbia University has resigned his post and will go to the Field Museum of Natural History in Chicago, to organize a department of East Asiatic ethnology. He himself will soon organize and conduct an expedition to northwestern China.

Dr. Henry Patterson Loomis, a specialist in pulmonary and heart diseases, died in this city December 22. He was a son of Dr. Alfred Lebbens Loomis, a specialist in the same lines. Dr. Loomis the younger was born in this city in 1859; was graduated from Princeton in 1880; and from the medical department of New York University in 1883. He studied also in Berlin, Heidelberg, and Vienna. From 1887 to 1895 he was professor of pathology in New York University; and from 1898 till his death, professor of therapeutics and clinical medicine in Cornell Medical School. He was a member of various medical societies; he had been president of the New York Pathological Society. To the "American System of Practical Medicine" he contributed the chapters on Bright's disease; in "American Jurisprudence and Toxicology" he contributed the chapters on post-mortem examination. He also wrote much for the medical magazines.

Prof. Oscar Lassar, a member of the medical faculty of Berlin University, died December 23 from the effects of an automobile accident. He was born in Hamburg in 1849, and received his education at Heidelberg, Göttingen, Strassburg, and Berlin. After service at Göttingen and Breslau, he went to Berlin, where he established a clinic for the treatment of skin diseases; and by 1893 he had attained the grade of full professor in the university. Dr. Lassar was especially interested in tuberculous affections of the skin, and was among the first to recognize the bacteriological character of many scalp diseases. This led him to consider the infectious nature of such troubles, and to lay great stress upon public hygiene. He was the founder of the German society for the promotion of public baths, and he established model baths in Berlin. He was also active in summoning to Berlin the international leprosy congress. He wrote many monographs on various phases of public health and hygiene, among them: "Kulturaufgabe der Volksbäder," "Volksgesundheit und menschliche Gesellschaft in ihren Wechselbeziehungen," and "Ueber häusliche Gesundheitspflege." Since 1893 he had been the editor of the *Dermatologische Zeitschrift*. The medical training of women was one of the movements in which he was interested. Apart from his professional works, Dr. Lassar was the author of one or two books. In 1892, under the pen name of Edmund Olass, he published a volume entitled "Novellen," and he also wrote "Geschichten und Gedichte für kleine Kinder," 1895.

Pierre Jules César Janssen, director of the Meudon Observatory, died December 23. He was born in 1824 in Paris. He was well known as a student and experimenter in the field of astrophysics, and particularly in spectrum-analysis. During the total eclipse of the sun in 1868, he observed that the sun's protuberances were produced by burning fluids, and in 1870 he discovered a new method of quantitative spectrum-analysis. Four years later he observed the transit of Venus in Japan, and on his way thither he carried on some magnetic experiments in the Gulf of Siam and in the heart of Bengal. At Janssen's instigation the great observatory on the summit of Mont Blanc was constructed in 1892, and since that time Janssen, although so lame

that he had to be carried to the observatory, had successfully directed a series of important observations there. He was a member of the Paris Academy and the Bureau of Longitudes.

Drama.

The English Stage of To-day. By Mario Borsa; translated by Selwyn Brinton. New York: John Lane Co. $2.50 net.

Dr. Mario Borsa is fortunate in his translator, Mr. Brinton, who has converted the original Italian into singularly fluent, idiomatic, and vivacious English, which lends additional charm to a series of essays, full of sound information, keen criticism, and much practical common sense. As a summary of the history of the modern English stage, in all its various phases, intended chiefly for the use of foreigners, the book is admirable in almost every respect, being comprehensive, without going into any of the tedious and insignificant detail which forms the bulk of most recent theatrical volumes; and, in the main, wonderfully accurate. Among the principal subjects which it passes in review, are the nature of English playgoers, actors, and actor-managers, the leading dramatists and critics, the Stratford-on-Avon celebrations, the work of the various independent theatres, the realistic and the literary drama, the Irish theatre, and the censorship. So far as matters of fact are concerned, it has nothing new to offer to the well-informed English reader, but this does not at all diminish the interest arising from the comment of an independent observer, thoroughly conversant with theatrical affairs, not only in Great Britain, but in his own country. And much of what he has to say is just as pertinent on this side of the Atlantic as on the other.

Of the generally forlorn condition of dramatic art in England he speaks with a good humored contempt which is, perhaps, more effective than any labored strictures. He attributes it largely to the innate stupid conservatism of the public, which, with its national passion for the "standardization" of everything, looks askance upon new forms and ideals even in its pleasures, and insists that what was good enough for one generation is good enough for another. Here he has fallen into the old delusion, carefully fostered by commercial managers everywhere, that the public has the power of dictating the nature of the entertainments to be provided for it. The truth is that it only has the right of selection between what is bad and what is worse. He only comprehends in part the powers and the influences of the commercial syndicates by which the theatrical world is governed. But he sees very clearly the evil wrought by long runs and demonstrates it most effectively by contrasting the achievements of the Italian stock companies, developed and maintained by healthful competition, with the work done under the star system. He ridicules the idea that a dramatic resurrection can be effected, as so many enthusiasts hope, by the means of a national theatre. This, he says, is an ancient fad which for more than a century "has been the occasion of endless ribaldry and waste of ink in Italy. Whenever the dramatic right cannot stand upright upon its own legs, the support of the state is at once invoked, as if the state could endow the public with taste, the playwright with genius, or the actor with that *diable* of which Voltaire spoke to Madame Duchesnoi." He then proceeds to speak of the miracle plays and pageants organized by the English guilds in the fourteenth and the fifteenth centuries and to regret the fact that feud should have arisen between Church and stage to check that growth of a genuine national passion for representative art which Louis N. Parker is now striving to revive. The history of the subsidized theatres of the world, he urges, proves that such institutions at the best can only imperfectly preserve standards, which after all may not be the best, but are powerless to produce inspired actors or dramatists.

In his sketches of prominent playwrights there is much acute criticism. Henry Arthur Jones he appreciates highly, but points out truly that his best work is marred by a survival of his earlier melodramatic tendencies, and his rhetorical habit. Alfred Sutro he describes as an astute playwright rather than a real dramatist with convictions. By Barrie he is plainly puzzled, praising parts of his work, but regretting his unconquerable juvenility. With the humor of W. S. Gilbert, he is delighted. Of Pinero, after expatiating upon his wit and his technical skill, he says: "If you come to analyze his plays in order to find in them a central idea, you will find that he has very little to tell you that is new, original or interesting." This is most potently true, as is a further remark that Pinero gives you "the view of a casual observer, not of a thinker."

It is interesting to note that Dr. Borsa, whose sympathies are all enlisted on the side of the realistic drama—literary, intellectual or problematical—is of the opinion that the influence of the Ibsen plays on the English theatre has been inconsiderable, and in this judgment he is doubtless justified, notwithstanding the occasional successes attained by "A Doll's House," and "Hedda Gabler," which owed much to such actresses as Janet Achurch and Elizabeth Robbins. English dramatists, seeking popularity, are not likely to take Ibsen as a model except in his methods of technical construction; and imitation in this respect would not always be readily detected. To the Stage Society Dr. Borsa gives a word of very sage advice. He says:

> In order to counteract the vacuous unintellectuality of the conventional English stage, the Stage Society makes a practice of giving the preference in its repertory to works of a serious, symbolical, philosophical, and social character. This is an antidote which may prove efficacious for a time, but woe to those who abuse it. The society would thereby run the risk of becoming atrophied and sinking to the level of a monotonous and morbid school.

A long review of the work of Bernard Shaw contains this pregnant sentence:

> His works, stimulating as at first they are, end by wearying us—because in these mental pyrotechnics we seek vainly for the clear, harmonious design of a fundamental thought.

In his paper on the literary drama Dr. Borsa discusses with much acumen, such diverse authors as Thomas Hardy, Swinburne, Tennyson, Browning, and Stephen Phillips. To W. B. Yeats and the Irish Theatre he devotes a most sympathetic and appreciative chapter. In his criticisms of actors he is both just and felicitous, except in the case of Shakespearean representations, as, for instance, when he ranks the Shylock of Novelli above that of Irving. But it is seldom that he goes so far astray as that. He has written a most attractive, instructive, and clear-headed work, which will repay the study of all persons interested in theatrical affairs.

William Jaggard of Liverpool, a descendant of the printer of the First Folio Shakespeare, has for a long time been at work upon an important Shakespearean bibliography, which is to include collations, descriptions, and notes of every known issue of Shakespeare's plays, poems, and collected works, as well as Shakespeareana, manuscript and printed. In all, there will be, he says, more than fifteen thousand entries. He promises details as to size and price later.

It is reported by cable that fourteen of Lord Howe's Shakespeare quartos, which were to have been sold with his collection at auction, on December 21, were disposed of privately. These, it may be assumed, will find their way to New York, even if they are not already here. Of the remainder sold at auction, the "King Lear," 1608, the second edition of this date, brought £200; "The Merry Wives of Windsor," 1619, £160; "Love's Labour Lost," 1631, £201; the First Folio, £2,025. The total of the sale, fifty-one lots only (less the fourteen sold privately) is reported as £5,203.

Alfred Sutro's latest play, "John Glayde's Honour," which was presented for the first time in this city, in Daly's Theatre, on Monday evening, proved a disappointment. It is inferior to "The Walls of Jericho" in almost every particular; in point, in reasonableness, and in execution. Like its predecessor, it is inspired by a serious theme of wide contemporary interest, and to this extent is superior to the ordinary machine-made drama of incident; but it is in its essence theatrical and specious, tricky and violent in device, and with little force of general application. Its main contention, that the husband—American or not—who is so absorbed in mere money-grubbing as to be utterly neglectful of his wife, and indifferent to her pursuits, through a course of years, is partly responsible for the errors of living into which she may fall, is sound enough, though rather trite. But the illustrations which he has chosen are so extreme that his moral is not very clear or impressive. Neither Glayde nor his wife can be accepted as typical, nor can either of them lay claim to much sympathy. The indifference of the one is more than offset by the gross treachery of the other. At the last the man, in bitter scorn, gives the faithless woman over to her lover, with a promise to provide for her. He does this with an affectation of magnanimity, but he could scarcely have devised a more certain way of ensuring her lasting misery. As a whole, the play, in spite of some effective theatrical scenes, is melodramatic and unconvincing in its action, and unsatisfying in its conclusion. Doubtless it would have seemed more life-like if it had been more brilliantly acted. Mr.

Hackett's Glayde had physical but not intellectual strength, and Miss Darragh, an English actress of evident skill and experience, was nevertheless unequal to the emotional requirements of such a part as Mrs. Glayde.

Beerhohm Tree will hold another Shakespearean festival at His Majesty's Theatre in London next May.

Oscar Asche will appear in London next autumn in the part of Hannibal de Tavannes, Miss Brayton playing Clothilde, in a dramatic version of Stanley Weyman's "Count Hannibal."

Music.

Debussy's Pelléas et Mélisande: A Guide to the Opera. By Lawrence Gilman. G. Schirmer.

It has perhaps never before happened that a book has been printed about an opera which, although five years old, has been performed in only three cities. Debussy's "Pelléas et Mélisande" had its first production in Paris in 1902. In January of the present year it was given at Brussels, and three months later at Frankfort. The fourth city to hear it will probably be New York. Oscar Hammerstein has promised to produce it at the Manhattan Opera House, and he has now in his company two of the singers who were in the original Parisian cast—Miss Mary Garden and Mlle. Gerville-Réache. Walter Damrosch has already delivered a lecture-recital on the opera, and now comes Mr. Gilman with a guide of eighty-four pages to its mysteries and wonders. Great must these be if we are to believe the prophets. The assertion of a French critic that "it is necessary to go back perhaps to 'Tristan' to find in the opera house an event so important in certain respects for the evolution of musical art," strikes Mr. Gilman as, "if anything, overcautious." To him this work exhibits not only a new manner of writing opera, but a new kind of music, "a new way of evolving and combining tones, a new order of harmonic, melodic, and rhythmic structure."

Wherein lies the marvellous novelty of this music? In the first place, in its premeditated defiance of all the accepted laws of form and logic. It is "dim and wavering and elusive music"; it "drifts before the senses like iridescent vapor"; it is "without punctuation, uncadenced, irregular." But the worst is yet to come. Harmonically this music "obeys no known law—consonances, dissonances, are interfused, blended, reëchoed, juxtaposed, without the smallest regard for the rules of tonal relationship established by long tradition." There was a time when the plain bread-and-butter diatonic scale sufficed musicians. Chopin, Liszt, Wagner, and their followers, craved the delicatessen of the chromatic scales. But Debussy has shaped for himself a mode of utterance which derives from none of these influences. He has brought back the mediæval church modes which were in use before the modern major and minor modes came into vogue. Liszt may have made use of whole-tone progressions for special effects, but in Debussy they are ever present.

Nor is this all. Wagner was accused, ignorantly, of having banished melody from the vocal parts and relegated it to the symphonic orchestral part. Debussy admits, frankly, that in his score, "the melodic phrase is always in the orchestra, never in the voice." In his whole opera there is no vocal melody whatsoever. Nor, on the other hand, does he waste much time on the symphonic development of themes. For the most part, his orchestra is as simple as Mozart's, and throughout the five acts there are scarcely more than a dozen fortissimo passages. At first blush, the most audaciously novel of Debussy's principles is his contemptuous attitude toward melody. In his own words:

> Melody is, if I may say so, almost antilyric, and powerless to express the constant change of emotion or life. Melody is suitable only for the song (*chanson*), which confirms a fixed sentiment.

As a matter of fact Debussy's originality was anticipated just three centuries ago by Peri, the composer of the first operas ever written. He, too, deliberately banished melody from his scores; and his colleague, Caccini, like Debussy, boasted of his *nobile sprezzatura del canto*. The excuse for Peri and Caccini is that they had no examples of better things before them, as Debussy had.

Mr. Gilman is a champion and admirer of Debussy and his opera. To him it is "a beautiful and in many ways incomparable score." He loves the intangible "sound-wraiths" of which the music largely consists, because they reproduce the atmosphere of the play. Yet he does not fail to point out one of the foibles of his hero. Debussy, in one of his essays, sneers at the Wagnerian system of leading motives as "rather coarse"; yet he makes use of this same system throughout his score, though without Wagner's polyphonic and transforming genius. In the thirty pages he devotes to the analysis of the score, Mr. Gilman has singled out twenty-five motives and given them names. They are reproduced in musical type and seem, almost without exception, singularly void. The first chapter of the book is devoted to a sketch of Debussy's career and the development of his peculiar art, and this is followed by a readable chapter on the Maeterlinck play, on which the opera is based. An amusing detail is the quarrel between the poet and the composer. Angered by certain excisions, and by the choice of one of the singers, Maeterlinck published a letter of protest, in which he declared that inasmuch as the "Pelléas" of the Opéra Comique had become entirely foreign to him and escaped from his control, he could only hope that "its fall would be prompt and noisy." But it has proved a lasting success.

The twenty-ninth annual meeting of the Music Teachers' National Association will be held at Columbia University December 27 to 31.

The New York Symphony Society announces Mme. Schumann-Heink as the soloist at the subscription concerts on Saturday evening, December 28, and Sunday afternoon, December 29, at Carnegie Hall. These will be Mme. Schumann-Heink's first public appearances in New York this season. The orchestral numbers include Liszt's three symphonic-poems, which are entitled "A Faust Symphony." Mme. Schumann-Heink will sing the Brahms Rhapsody for solo voice and male chorus, and Adriano's aria, "Gerechter Gott," from the second act of "Rienzi."

The Olive Mead Quartet will give a concert in Mendelssohn Hall Thursday evening, January 2, with Arthur Whiting as assisting artist. This is the first New York appearance of the quartet with the new second violinist, Miss Helen Reynolds.

Art.

THE WINTER ACADEMY.

There are a good many things which the present exhibition of the Academy is not, and it will undoubtedly be criticised for not being these things. For instance, it is not an exhibition composed entirely of the works of one limited school of our younger painters. It is not a select and small exhibition, carefully arranged with ample space around each work, and showing each work to the utmost advantage. It is not a large exhibition got together by the lavish expenditure of time and money and filled with borrowed works selected from the best that have been produced in this country within ten years. It will be compared, to its disadvantage, with both kinds of exhibition, and will be found fault with for not being the one or the other. It is not even an exhibition fully representative of the membership of the Academy, for it would be easy to make a list of admirable artists, members of that body, who, for one or another reason, have not been able or have not chosen to exhibit. The present exhibition is, then, the lesser of two exhibitions which the Academy is obliged to hold annually through lack of space to include in one exhibition all the desirable work in oil painting, almost exclusively, produced in this country during the year. For work in other branches of art, except to a minor degree for sculpture, it does not pretend, under present conditions, to provide at all. It is a purely voluntary exhibition, composed of such work as the artists send in of their own initiative, and does not, I believe, contain a single borrowed picture. It is an exhibition almost entirely of current work. It is an exhibition not of the best art produced in America, but of the fair average of current professional work. Be it noted, in passing, that the Academy provides practically the only such exhibitions in this country, and that from its exhibitions the exhibitions of other cities are largely made up.

This being the modest claim of the exhibition, it does, I think, afford well-grounded encouragement to the believers in the future of art in America. It is an exhibition without a sensation, without a picture, or two or three pictures, which will be remembered to the exclusion of everything else. The foreshortening of time, which crowds the perspective as it recedes and makes us think of the best pictures of a decade as characterizing each of the "exhibitions of the eighties," might lead us to think this exhibition inferior to some of its forerunners. On the contrary, I believe that the general level of attainment has

never heen so high or so uniform. It is this high general level, indeed, rather than the lack of especially good works, which prevents any particular picture from making a special appeal. Each picture looks better for the good company it is in, hut none looks manifestly superior. With thirty years' experience of picture galleries to sharpen my instinct, I had yet heen several times around the exhibition before my attention was aroused by one picture—a large picture conspicuously placed in the centre of a panel—one of the best landscapes ever painted hy one of our hest contemporary landscape painters. I refer to Decemher by Leonard Ochtman; a piece of delicately felt color and delicately adjusted values unmistakahly distinguished. Had it heen a small work, or had there heen any tenuity in its refinement, one might have overlooked it without suhsequent surprise. It is above the average in size, and there is plenty of rohustness in its pale coloring. That one had not sooner discerned it, was simply a trihute to the general excellence of its surroundings.

Besides the air of general efficiency and workmanlike ahility which characterizes this exhihition, the things which strike me as of good augury are three. The first is the clear demonstration of the fact that the day is past when our art could he justly censured as exhibiting nothing hut the pale reflection of this or that foreign school. The men whose work is shown here are well trained, most of them hy some study in Europe, but there is nevertheless an unmistakahle accent ahout this collection which could he found in the exhihitions of no other country. It is not merely that the artists are individual and have each a personal way of looking at nature and of envisaging art—in spite of a great diversity there is a surprising homogeneity, a sense that we are in the presence of men of one race and of one country. As far as modern couditions will permit the existence of such a thing anywhere, we have to-day a national school of painting.

The second encouraging aspect of this exhihition is that the day of mere sketching—of notes and studies and hits of painting only—is also well over. Our painters are producing pictures—let me hasten to add that hy pictures I do not mean illustrations, and that the telling of a story or the depiction of an incident is not necessary to picture-making. It is true that the greatest of painters have not heen above telling stories—witness Michelangelo and Rembrandt—but Chardin painted pictures also, though his suhject might be no more than a jug and a loaf of hread. A picture is a thing with a design; a thing in which a definite conception has heen wrought out with all the completeness possihle to the artist; a thing in which the delights of imitation and of craftsmanship are suhordinated to some previous intention. The intention may he illustrative, as with Francis D. Millet's excellent and careful Rook and Pigeon, or purely decorative, as with Hugo Ballin's The Bath, which thoroughly earned the Isidor medal, awarded for the first time at this exhihition; it may he partly decorative and partly allegorical, as with Louis Loeh's delightful Twilight, or it may include the interpretation of a personality or of an aspect of nature as with more than one portrait or landscape. The essential thing is that there should be an intention, and that the intention should he realized as far as the ahility of the artist will allow. Of such things, good or had, but at any rate pictures in their motive and treatment, there are so many in the exhihition that they seem to dominate it.

One fancies that the increasing practice of mural decoration in this country, with its evident necessity for something more than clever painting, has not been without its effect in teaching our artists to think more pictorially. It can hardly he douhted that the influence of mural painting is to he seen in the third characteristic of this exhihition—its evidence of a growing desire for color. When our artists began to paint upon walls they were forced to design, and they were forced also to get out of their acquired hahits of painting with chalk or soot or mere opaque and muddy gray, and to attempt the use of color in its fullness and for its own beauty—to do in oil what the water-colorists have never forgotten how to do. Whether or not this is true, the fact of keener attention to color is patent. The walls are alive with it—picture after picture is full of it. It is not always successful color; it is sometimes crude and glaring, insufficiently harmonized, but it is color. And in the hest instances it is really beautiful color. The landscape painters, those of more or less impressionist tendencies, have hegun to see, as their master Monet always saw, that nature is full-colored, and that light is not a matter of white paint or of pale violet and hlue. The tonalists are beginning, apparently, to he convinced that tone is not merely a matter of hrown glazes. There are still canvases that are opaque and chalky. There are a few painters that cannot get free from ivory-black, like George Bellows, with his powerful, impressive study of the Pennsylvania excavation. But, for the most part, color, strong and pure as the painter can make it, reigns. Mr. Ballin is superh in his deep blues and greens, and pearly flesh; Mr. Loeb has, perhaps, carried his search for suhtlety a little too far, and is a trifle vaporous; hut his picture is full of charm and is thoroughly carried out. There are splendor and force in the rich granite reds and ocean blues of Paul Dougherty's Twisted Ledge, and a quieter, hut equally powerful, gamut of color in his Surf Ring, where the water is grayed by the heaten foam. There is great distinction in Howard Gardner Cushing's Silver Dress, which has exquisite passages of color, although the background strikes one as not quite in key; and much heauty in the black and gold of Birge Harrison's Hidden Moon. It is his blue and white and gold that make the success of Alhert L. Groll's recent works, like The Cloud—Arizona, and his hrilliant green and silver that one admires in Edward F. Rook, as it is masculine truth of color that is the finest quality of E. W. Redfield's several contributions. And, frank painter from nature as Mr. Redfield is, even he is beginning to think a little more of his picture and a little less of his facts.

Beauty of line has always heen a rarer quality in art than heauty of color, and draughtsmanship of intrinsic interest is rarer in this exhihition than good color—partly, perhaps, hecause our hest draughtsmen are too much engaged in decorative work to have time for the painting of easel pictures. But there is a fine feeling for line and for the beauty of the forms of childhood in Sargent Kendall's Reflection, and there is linear beauty also in Willard D. Paddock's Quiet Valley—Mr. Paddock always shows a sense of design—and in Frederick J. Waugh's two marines. Mrs. Lucia Fairchild Fuller's miniature, Près d'une Claire Fontaine, is a dainty piece of work, of which, perhaps, no one else we have is quite capahle; and rhythm of line and the movement of the human figure is the main motive of Bryson Burroughs's Start Before Sunrise.

Among portraits with pictorial quality may be ranked W. T. Smedley's Carnegie prize picture, Book-lovers, as well as Lydia Field Emmet's Sisters, which received the Proctor prize. Mr. Smedley's family group is well composed and well drawn and painted, after its manner. It is prohably in portraiture that "direct painting" will hold out longest against the desire for color and for heauty of material. This is workmanlike, and his fellow craftsmen have justly recognized its merits. Personally, I prefer Miss Emmet's other very ahle portrait, that of a father and son, to that of The Sisters. The douhle portrait of a mother and child hy Mrs. Edith M. Prellwitz has charm of expression and of characterization in a greater degree than mere technical power, though its technical accomplishment is considerahle. J. W. Alexander's hrilliant sketch of the veteran landscape painter, Mr. Whittredge, has an interest from the personality of the sitter as well as from the dash of Mr. Alexander's handling.

Serious picture-making is shown in one way or another in such landscapes as Arthur Parton's Freshet, the most vigorous thing of his I remember; in W. A. Coffin's Early Morning in May, not quite free of a certain dryness, but well composed, well drawn, and well colored, perhaps his hest work; in Charles Rosen's fine Frosty Morning; and careful composition is to be found in M. H. Bancroft's Mater Amoris, as well as a charming head, while his little picture of two nude figures called Morning is distinguished by great delicacy of tone. One is glad to believe from the presence in a place of honor of Rohert Henri's Girl in a Yellow Satin Dress, that the quarrel of that gentleman with the Academy is not irreconcilable. Prohahly it was never so bitter as it was painted hy the press. The picture is one of his best. One is glad for the same reason, apart from the merit of the work itself, to see here Ernest Lawson's Snow Bound Boats, an admirahle example of his personal methods. But one cannot catalogue every work of merit in more than four hundred, and I can mention hut one more picture, C. W. Hawthorne's Venetian Girl. Mr. Hawthorne's undouhted talent was wont to permit itself a rather riotous indulgence in paint, which was sometimes distressing to his friends. The result of a stay in Europe has been a chastening of his vigor, and this work is quiet, restrained, admirahle. Other illustrations in plenty of the good promise and present achievement of the American school of painting, the visitor to these galleries may be trusted to find for himself.

For many reasons the sculpture exhibited is less significant. All that is made clear

by the twenty or thirty small pieces shown is the growing influence on our younger men of the work of Rodin—an influence quite unavoidable and likely to continue for some little time longer. It is shown acceptably in such works in marble as The River's Return to the Sea, by Chester Beach, or The Dregs of Love, by Robert Aitken, where it has led to a finding and losing of the form that is not without charm; not so acceptably in the latter artist's bronze Mercury, where the rather ostentatious ugliness of the pose of the right foot goes far to ruin a figure of some merit. Karl Bitter's able and graceful Testimonial Tablet is almost the only contribution from any of our better-known sculptors. One cannot blame them for abstaining. Under the present conditions it is impossible to exhibit sculpture properly. For that alone, we need the new galleries which are needed for so many other reasons. KENYON COX.

Miss Birnie Philip, legatee of Whistler, has several hundred letters of the artist which she is preparing to publish. She will be glad to have the use of any further letters; her address is care of Watkin Williams, Steel & Hart, No. 54 New Broad Street, London.

There are always books on art of which one wonders why they were written, or when written, printed. Of such is Frederick Seymour's "Siena and Her Artists" (Philadelphia: George W. Jacobs & Co.). Mr. Seymour is enthusiastic about Siennese art, but has no other discoverable qualification for writing about it. He is unable to tell the reader what it is that he finds admirable in the things he admires, and his criticism reduces itself to a reiteration of the statement that the things are fine. Once, indeed, he attempts something more, and prints nearly four pages describing the wonderful things he reads in the expression of a Madonna by Neroccio di Landi—a Madonna revealed by his frontispiece as a very badly drawn figure with an inane simper.

Walter Crane has lived for more than sixty years, and has known many of the most interesting people of the artistic and literary world of nineteenth-century England. When, therefore, he publishes "An Artist's Reminiscences" (The Macmillan Co.), one expects to find them good reading. One is wofully disappointed. Either the people he met never did or said anything in his presence, or he immediately forgot what they did or said. The volume reads like an expansion of the kind of skeleton diary some people keep—the kind of diary that tells where they went and with whom they dined, and nothing more. For instance, Mr. Crane is able to tell us just how many sittings he gave to Watts for his portrait, and under what circumstances, but to tell us nothing whatever about Watts's personality, conversation, or method of working. The book is, indeed, a dreary waste of insignificant matter, couched in a style at once slipshod and affected.

"Griechische Bildwerke," by Max Sauerlandt (Leipzig: Karl Robert Langeweise), is one of those well-contrived albums of art reproductions in which the Germans excel. It contains 140 good half-tone cuts of fine examples of Grecian sculpture from the earliest times to the Roman conquest. Greco-Roman copies are in the minority and their secondary nature is always noted on the plate itself. Recently discovered masterpieces are included: the Discobolos of Castel Porziano and the amazing Niobid dug up last winter at Rome, but the Priestess of Castel Anzio does not appear—possibly the editor fears with certain timorous critics that it is not Greek: nor yet the beautiful bronze portrait head at Boston, called an Arsinoë. The collection may be recommended for school use. It would be hard to find better value at the price, one mark eighty pfennig. This pamphlet is the first of a series to be called Die Welt des Schönen. The text which, in the present instance, is accurate and in good taste, will be subordinated to the illustrations.

Sir William Richmond's portrait of Dr. A. J. Evans, keeper of the Ashmolean Museum, Oxford, was formally presented to that institution on December 7. Among the subscribers to the portrait fund were fifty-five Americans. The picture represents Dr. Evans in the light workaday costume of his predilection, surrounded by the vases, sculptures, and frescoes unearthed at Cnossos. Its background is an exceedingly beautiful Cretan landscape, while the middle distance is occupied by the walls of the great Labyrinthine palace. On the occasion of the presentation Dr. Evans spoke, among other things, of enlargements now in contemplation and of a generous endowment for the organization of an Egyptological Room, where the remarkable series, derived by the Ashmolean from the Egypt Exploration Fund in coöperation with Professor Petrie, might be suitably shown. He finally expressed the hope that what had so far been achieved might be the stepping stone to a still more sound and solid organization and still larger development, so that the whole fine art department might be placed upon a new and permanent basis in which the Renaissance objects of all kinds should be grouped together with the pictures in a thoroughly scientific manner.

Prof. Flinders Petrie and Mr. Mackay of Bristol have selected the site of Memphis for their excavations this year. The importance of this undertaking will be realized if we remember that Memphis was the capital of ancient Egypt, and that her history reaches back to the beginnings of Egyptian civilization. Here was the seat of the Memphite school of sculpture, the finest in Egyptian art, and here was the famous temple of Ptah, which was first founded by Menes and enlarged repeatedly by a long succession of kings. The site, which covers an area of more than 100 acres, has never before been excavated. The difficulties in the way of the work will undoubtedly be great, as the land is under cultivation.

Among the exhibitions at the dealers in this city are portraits by Adelaide Herter at M. Knoedler & Co.'s, till December 30.

At Christie's auction, London, December 10, the following prizes were paid for engravings: Lady Taylor, by W. Dickinson, after Reynolds, £100; and The Snake in the Grass, by W. Ward, £105.

Finance.

TWO CAUSES OF THE FINANCIAL COLLAPSE.

Every financial breakdown is followed by reports, from receivers of insolvent banks and companies, from directors and promoters who had a hand in the preceding speculation, and from investigating committees—documents which are read by the general public with sentiments very different from those with which reports on the same undertakings would have been received before the crash. The balance-sheet of the National Cordage Company in 1893, the statement of assets of Overend, Gurney & Co. in 1866, the reports on the State banks of 1857 or on the Reading and Atchison railways of 1893, are examples in point. What was true after those other panics is true, and will continue to be true, after the panic of 1907. A partial test of this changed disposition, on the public's part, has already been provided by two events.

RAILROAD AND INDUSTRIAL STOCKS

We have prepared a special circular describing a selected list of standard railroad stocks and a few of the better class of industrial stocks listed upon the New York Stock Exchange.

Write for Circular No. 439

Spencer Trask & Co.

William and Pine Sts., New York.

Member New York Stock Exchange.

Letters of Credit

Buy and sell bills of exchange and make cable transfers of money on all foreign points; also make collections, and issue Commercial and Travellers' Credits available in all parts of the world.

International Cheques. Certificates of Deposit.

BROWN BROTHERS & CO.

No. 59 Wall Street, New York

published its annual report. Since this document showed, during the fiscal year under review, a state of prosperity and earning power which few enterprises of the sort have paralleled, one might suppose that here, at least, no ground for reminiscent wrath could be discovered. The contrary is true. Morier Evans, the English historian of our panic of 1857, observed in his account of that episode, published two years later:

It is a remarkable fact that whilst, as much as fifteen months before the American crisis, a general distrust of the railway system prevailed throughout the United States, public opinion in England was unaffected up to the verge of August and September.

But he adds, in retrospect, that recognition of "the fearful indiscretion in the financial management of American railways has been among the prominent results of the late crisis." History repeats itself, and the Union Pacific annual report, along with its brilliant show of earnings, had to make confession, not very frankly or plainly, of that company's own part in the reckless inflation which finally broke the back of credit. Confronted in July, 1906, as all intelligent railway men knew that it was confronted, with exceptional requirements for new expenditure in the face of a vanishing demand for new securities, the company nevertheless had on hand, in cash or in readily convertible demand loans, no less a sum than $55,968,000. Instead of applying this surplus to its own urgent needs, the company plunged the whole of it into purchase, at the extravagant prices then prevailing, of stocks in a dozen other railways, some of them at the other end of the continent from the Union Pacific's territory.

This was not all; the company then proceeded, within the same six months, to throw $75,725,000 more into similar purchases, raising for the purpose temporary loans. To make these obligations good, this prosperous railway company—earning, as last week's report sets forth, 17½ per cent. on its common stock—had, in the face of the gathering financial storm last July, to sell its bonds to the amount of $75,000,000 at sacrifice prices. The annual report admits that the loss on this investment of $131,693,000 of Union Pacific funds in Stock Exchange securities, as gauged by comparison of the purchase price with that of June 29, 1907, the end of the fiscal year, was $23,149,000. Nor, indeed, is this all; for since that date—taking last Friday's quotations—the price of the $14,000,000 in New York Central stock thus purchased has fallen 18 points further, of the $10,000,000 in Atchison, 21 points, of the $32,000,000 in Baltimore and Ohio, 12, and so on. Considering what imitators the Union Pacific had, and what use was made of its speculations in promoting the mad exploits on the Stock Exchange towards the end of 1906, we have in these figures an instructive chapter in the story of the panic of 1907.

Another reminiscence, with a similar bearing, was suggested by last week's report of the committee of New York bankers. Any one who reads the economic histories of the panic of 1857 will learn that American banks, outside of the older Eastern sections, were investing deposits in whatever suited the personal ideas of the managers; that the fixed and not easily convertible investments—notably real estate—in which demand liabilities were thus tied up, prevented conversion of securities into cash when the storm broke, and that cash reserves of 5 to 11 per cent. which had been deemed sufficient against outstanding notes and indebtedness to depositors, turned out wholly inadequate. That this sort of "wild-cat banking"—the phrase was invented in 1857—was a powerful influence in undermining prosperity and causing the frightful panic of that year, is taught in every primer of economics. When that utterly vicious system was reformed, a few years later, people could hardly have imagined that, after an interval of half a century, in New York State, banking institutions with $850,000,000 demand deposits would be doing business under a law which allowed them to invest such deposits in the very fields where the experiments of the deposit banks of 1857 resulted so disastrously—a law, furthermore, which did not even require the cash reserve of 1857. The report of the Governor's committee of bankers, touching this very subject, is discussed more fully elsewhere.

G. P. PUTNAM'S SONS
New York London

An Economic History of the United States

By E. L. BOGART, Ph.D., Princeton University. With Maps and Illustrations. Crown 8vo. About 500 pages. $1.75.

Beginning with the explorations and settlements that led to the colonization of the continent, the author traces the growth of industry, agriculture, commerce, transportation, population, and labor, from the simple, isolated agricultural communities of the colonies to the complex industrial and commercial society of to-day.
